Pokémon

# (Brief!) Introduction!

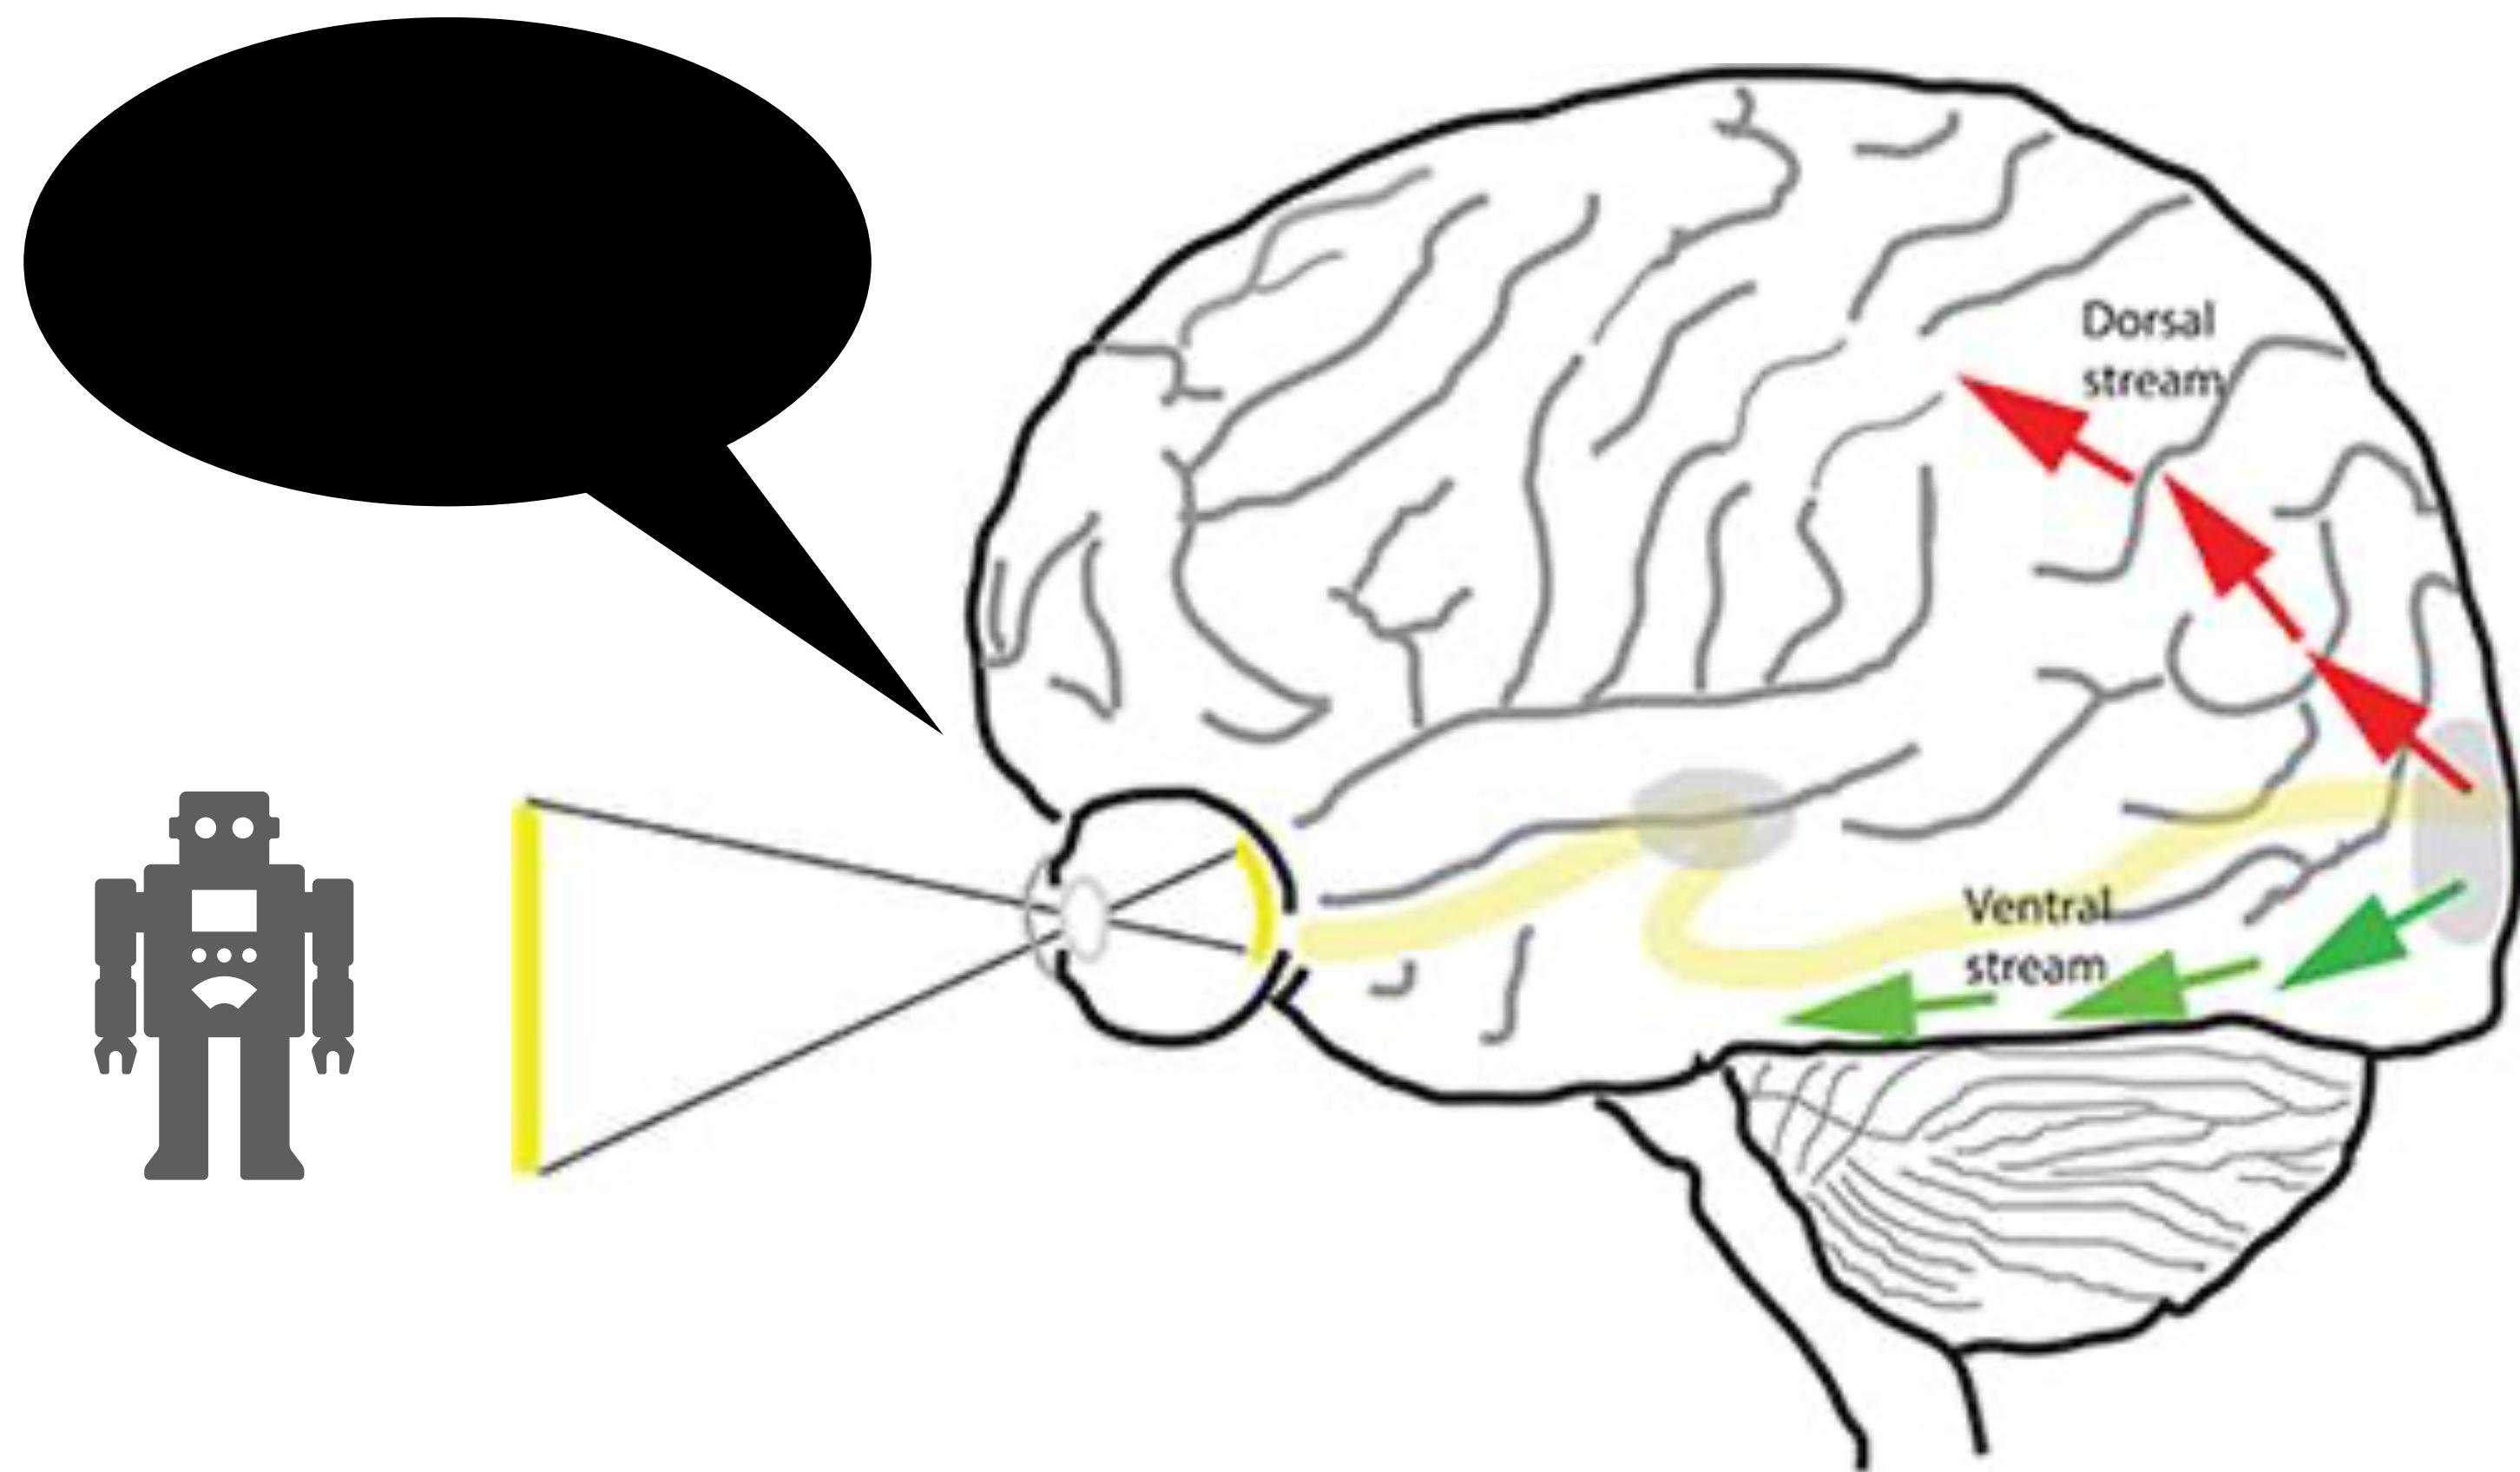

# Ventral Visual Stream

Recall that when we process visual stimuli, this information gets processed by retinal ganglion cells —> LGN —> to our primary visual cortex (V1).

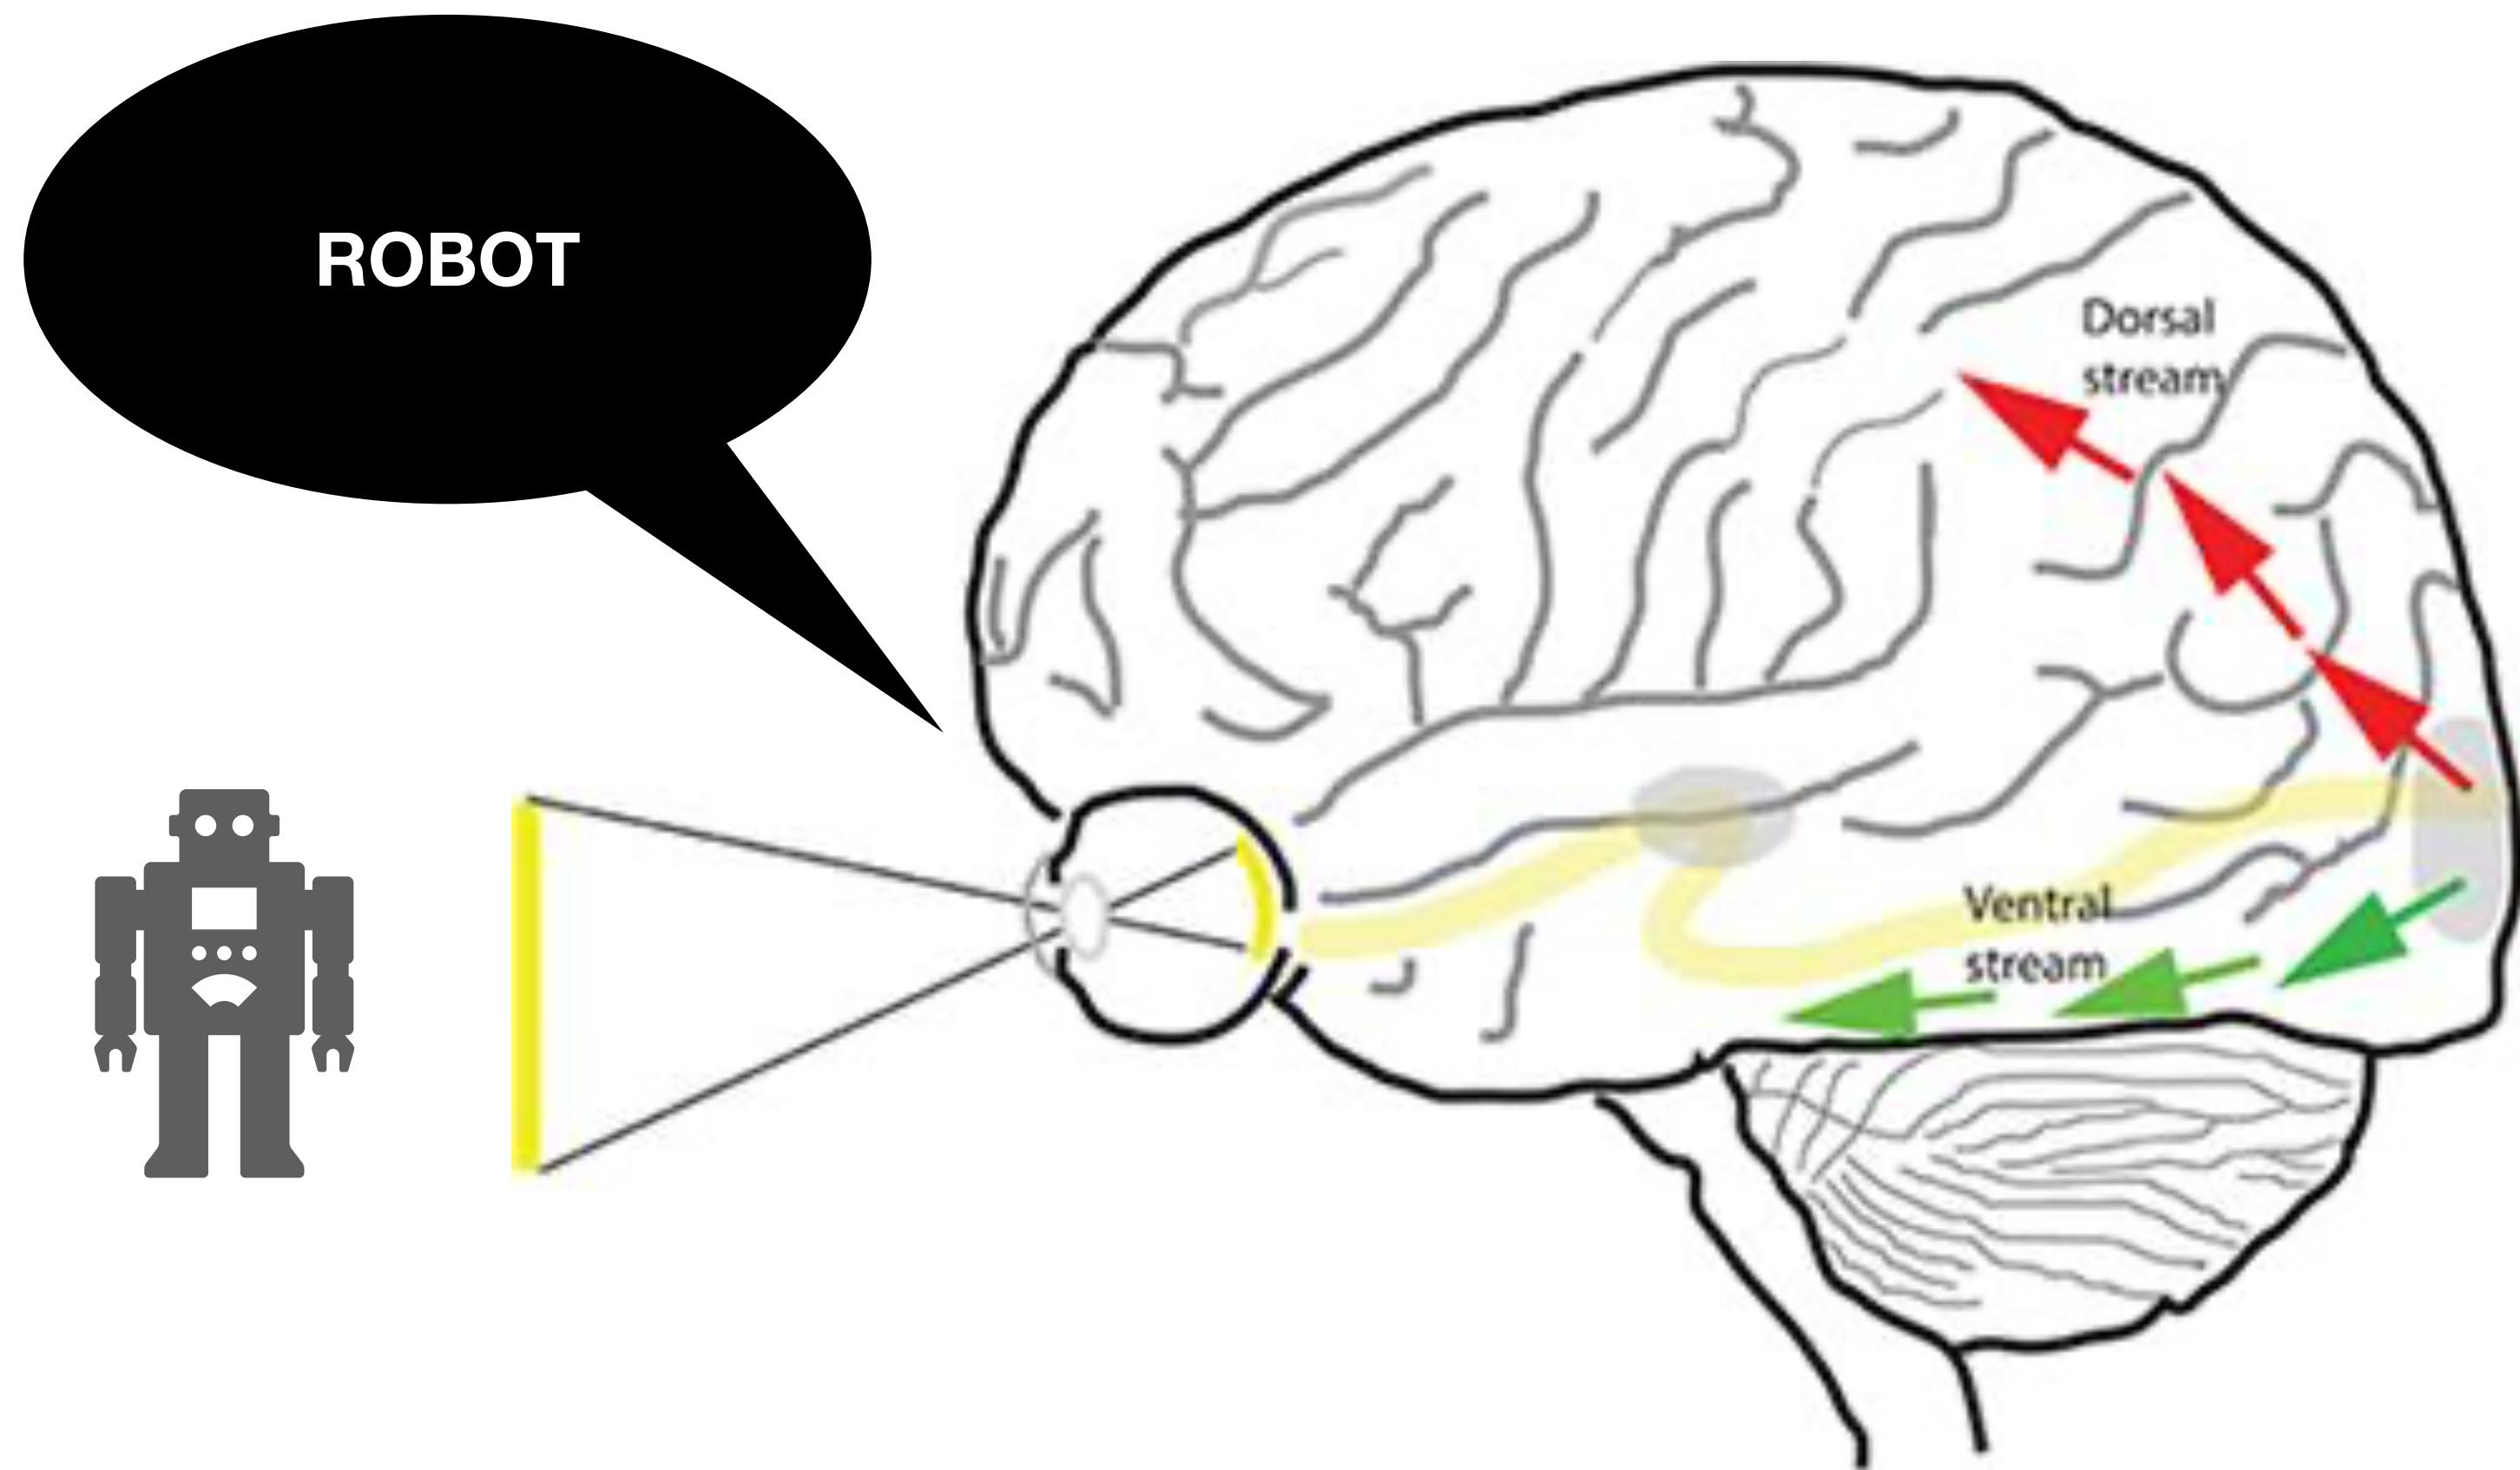

# Ventral Visual Stream

We also have an extraordinary ability to recognize a range of stimuli quickly, thought to be the result of rapid cortical computations that occur within our visual stream (from V1 up to the ventral temporal cortex; VTC)

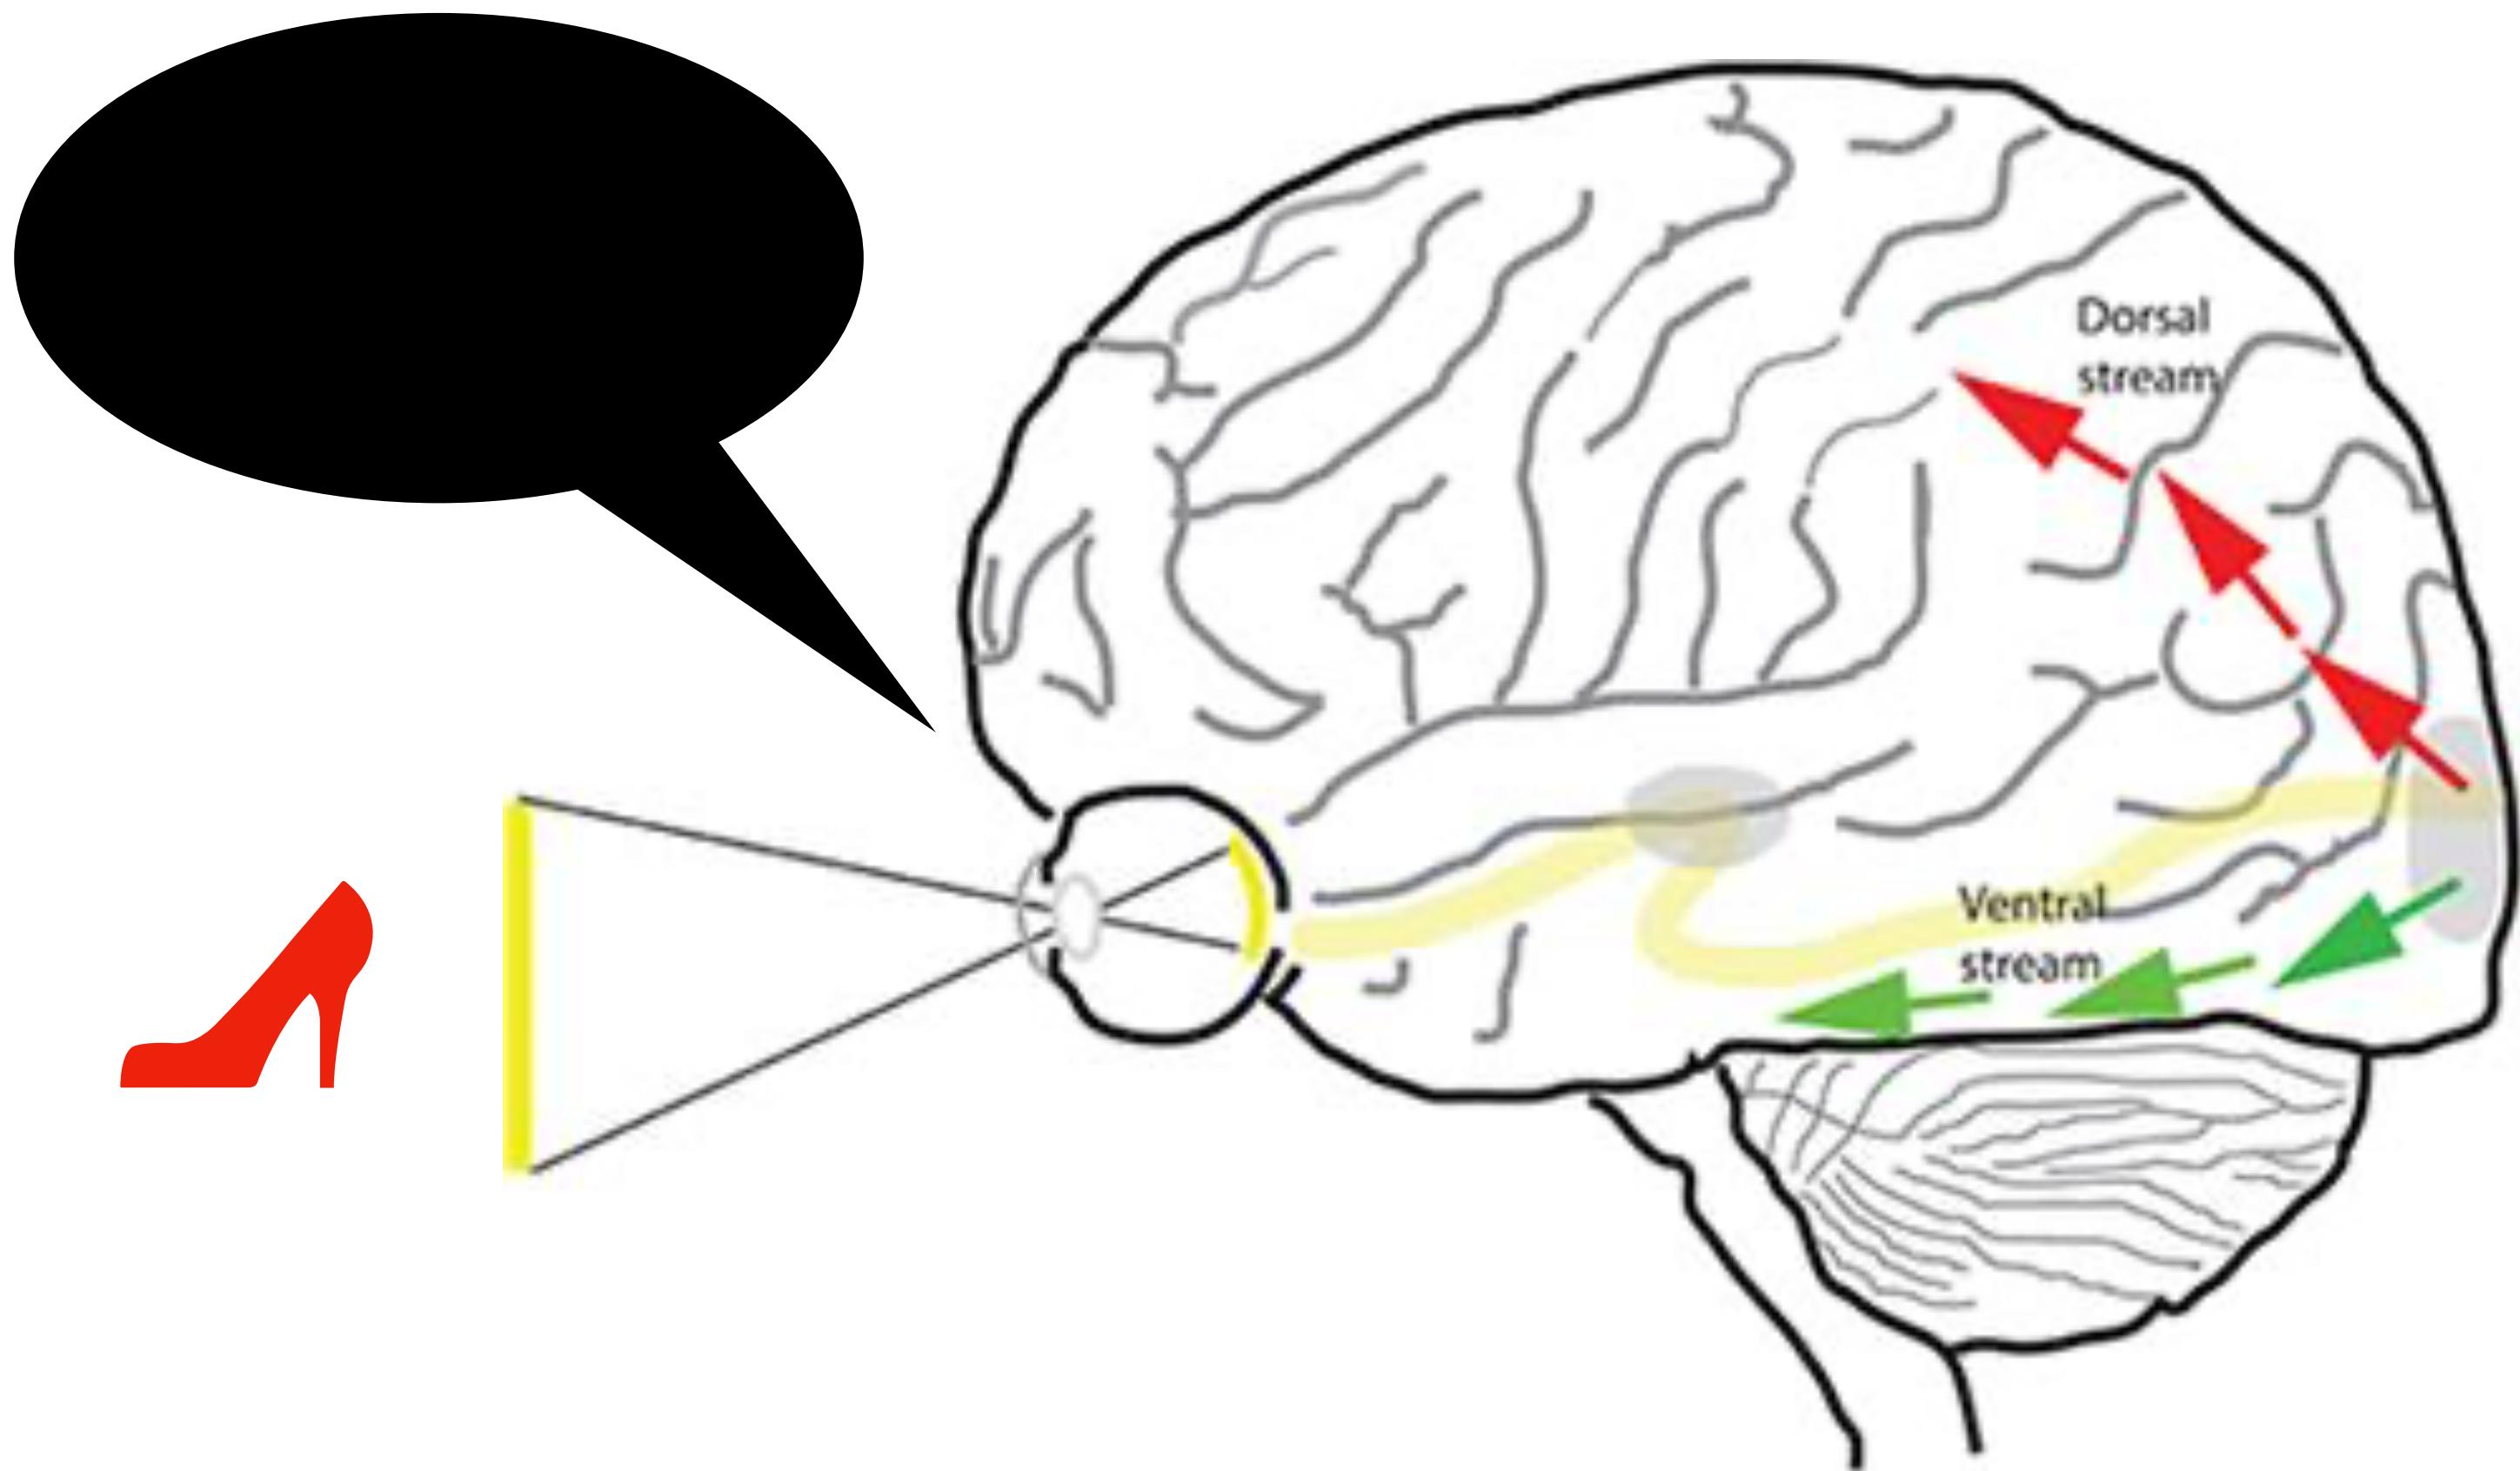

# Ventral Visual Stream

We also have an extraordinary ability to recognize a range of stimuli quickly, thought to be the result of rapid cortical computations that occur within our visual stream (from V1 up to the ventral temporal cortex; VTC)

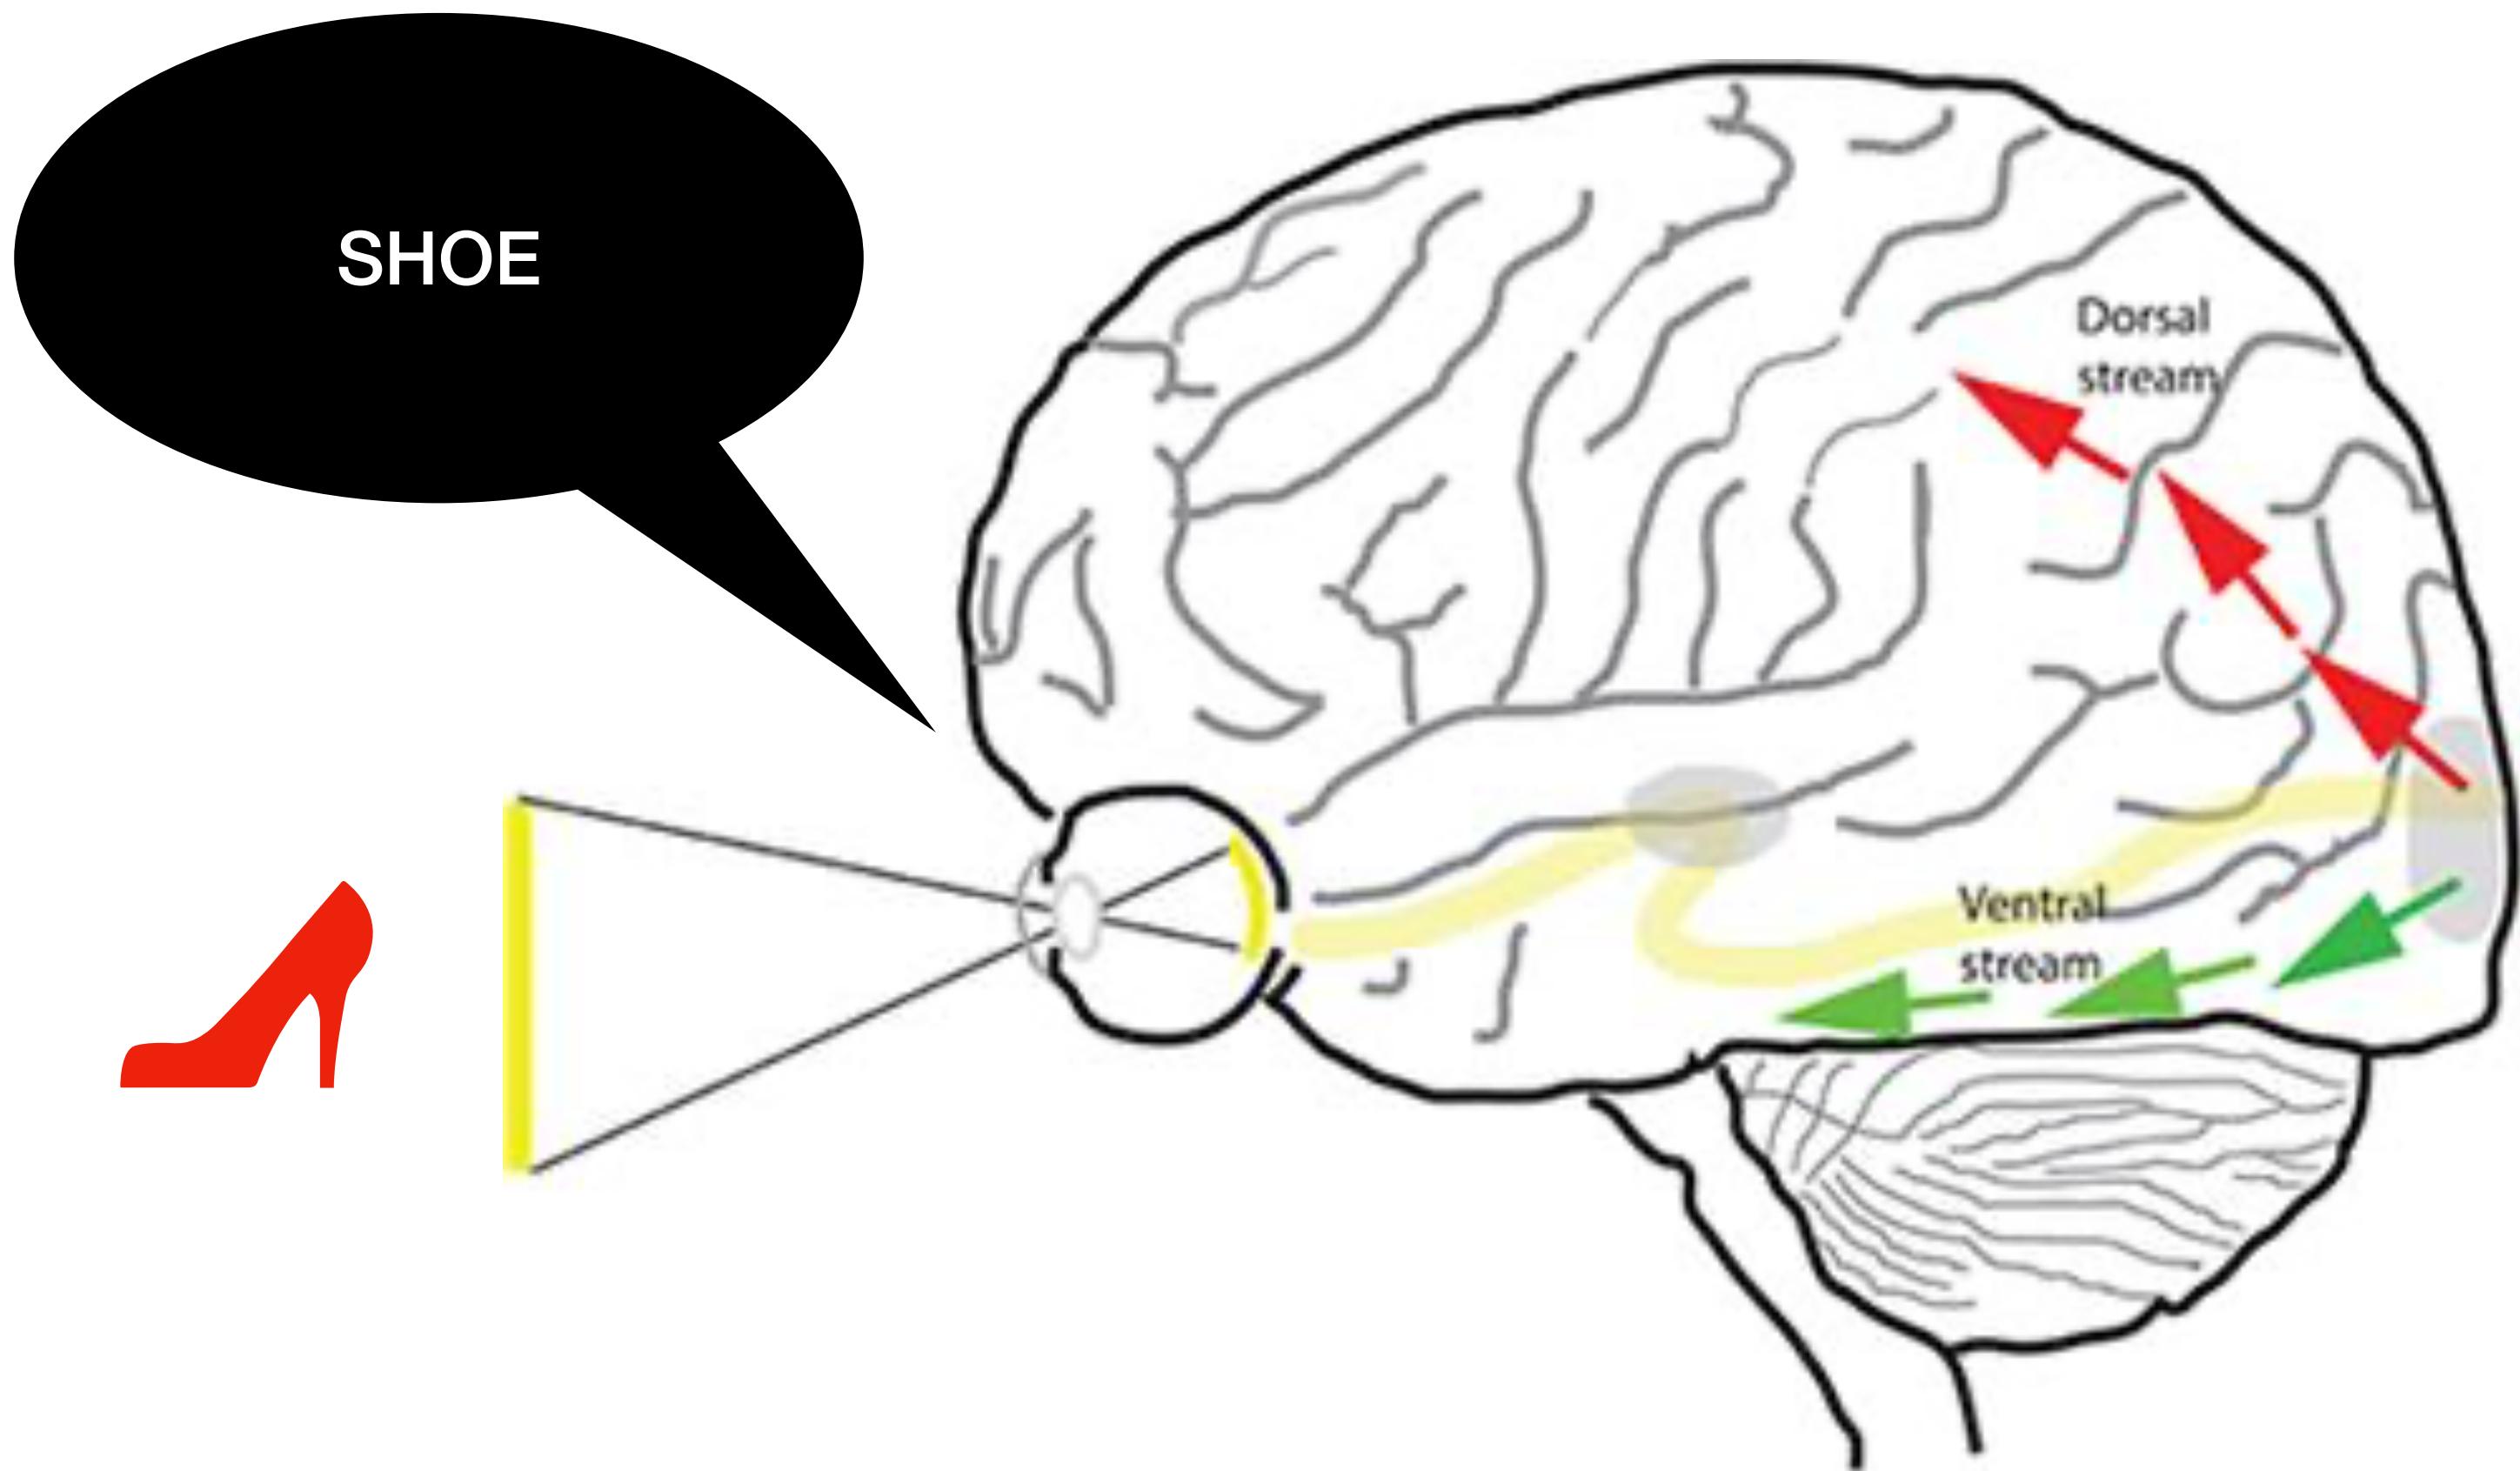

# Ventral Visual Stream

**What experiences in childhood leads to the consistent spatial functional topography of the VTC? Is it the way we see images OR is it image-level details of the stimuli itself?**

# The Present Study

# Questions they aim to address:

1

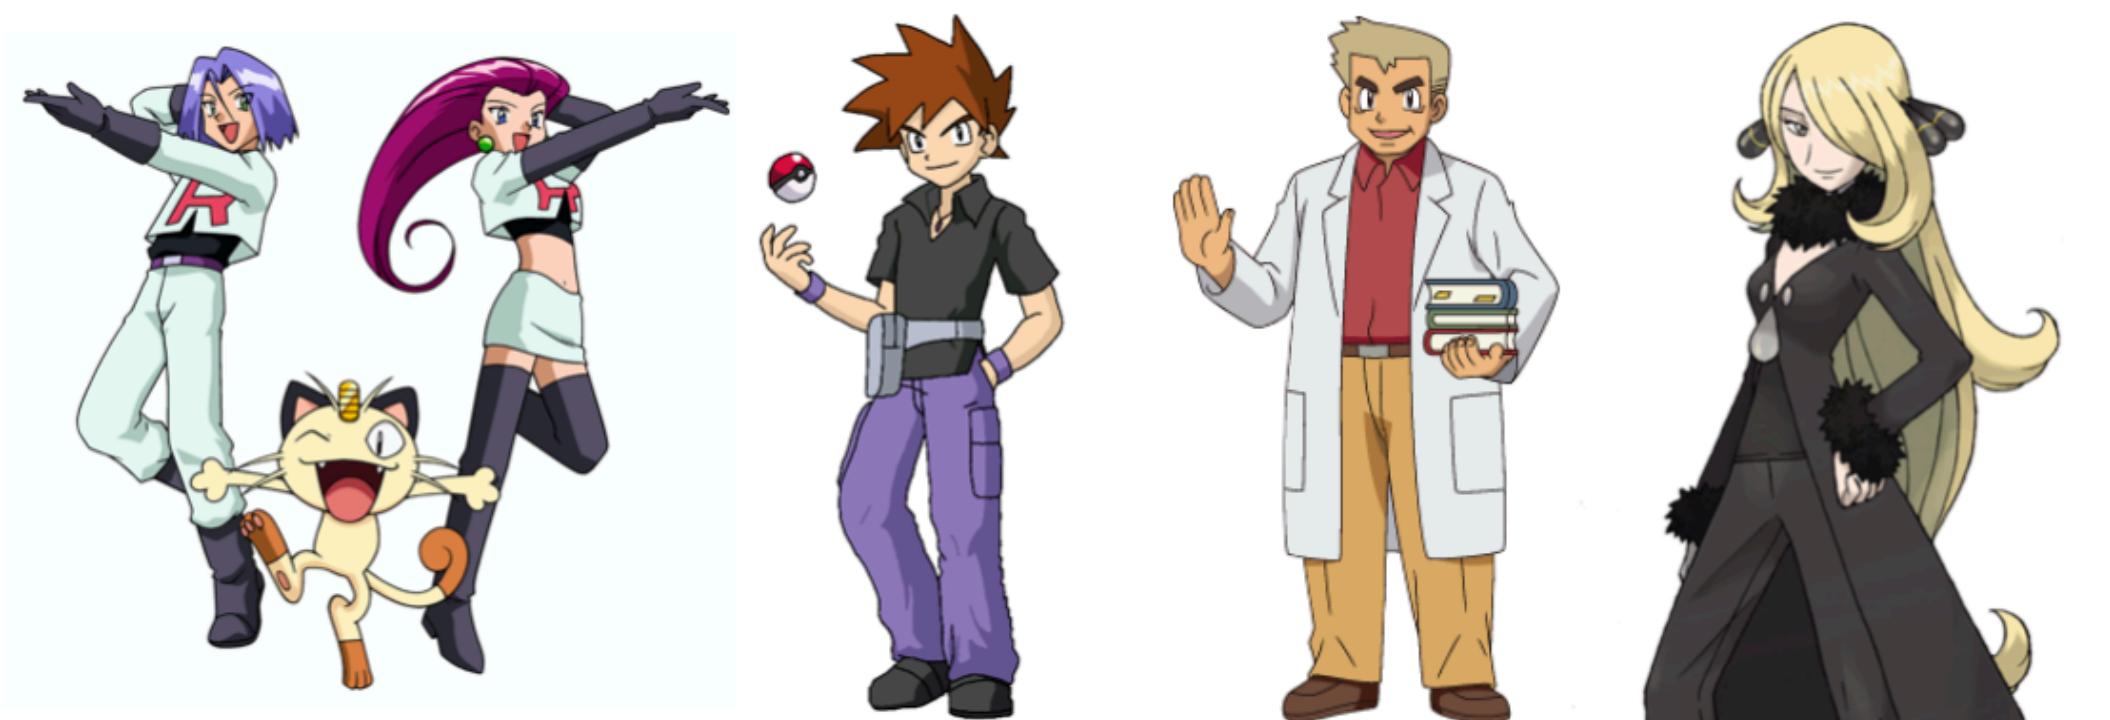

Does extensive experience with Pokemon from early childhood to adulthood result in novel representation in the visual cortex?

2

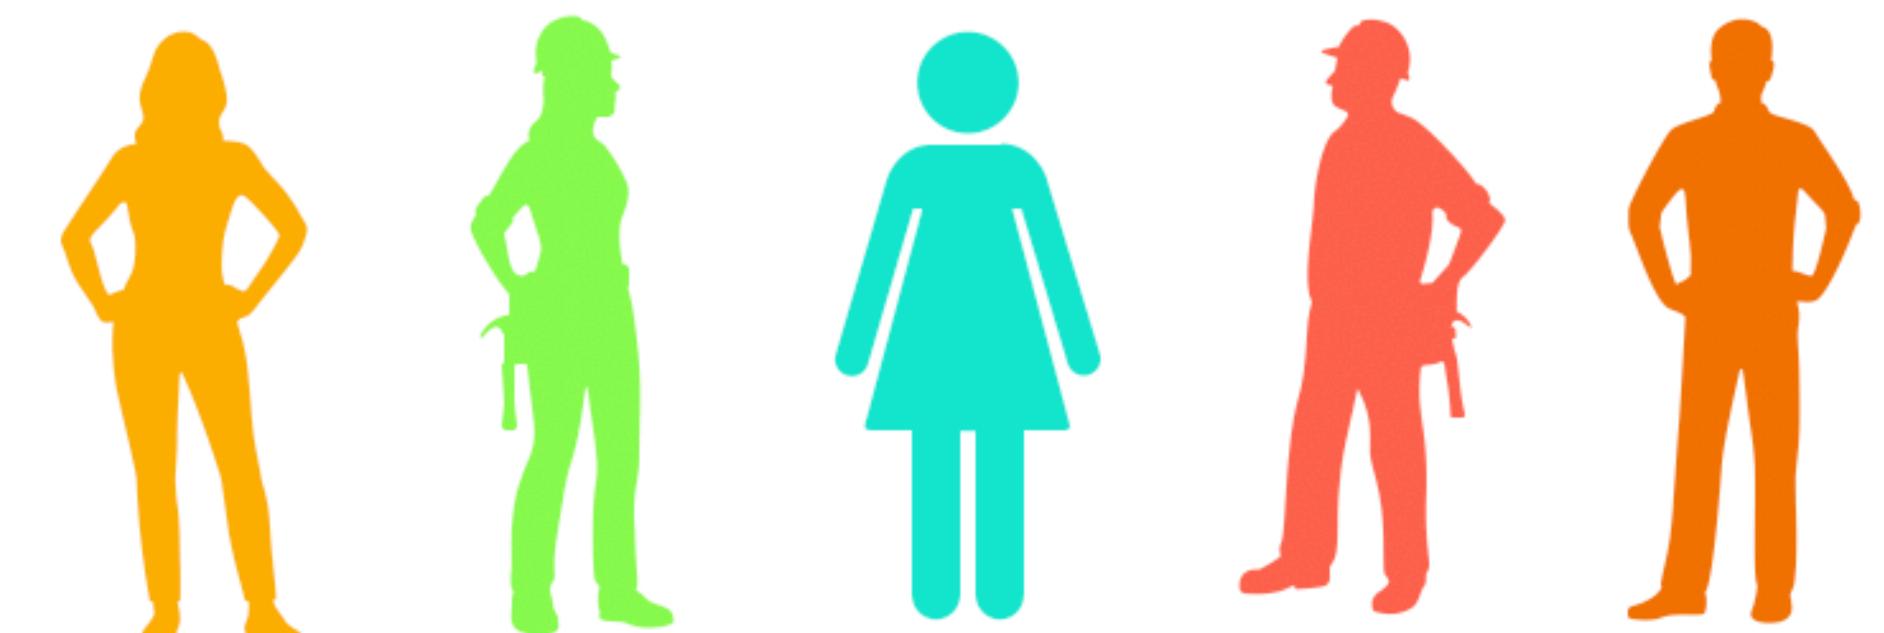

Does the features of Pokemon help us theorize which features of visual stimuli drives the development and topographical organization in high-level visual cortex?

# The Participants

**11 Pokemon Masters!**

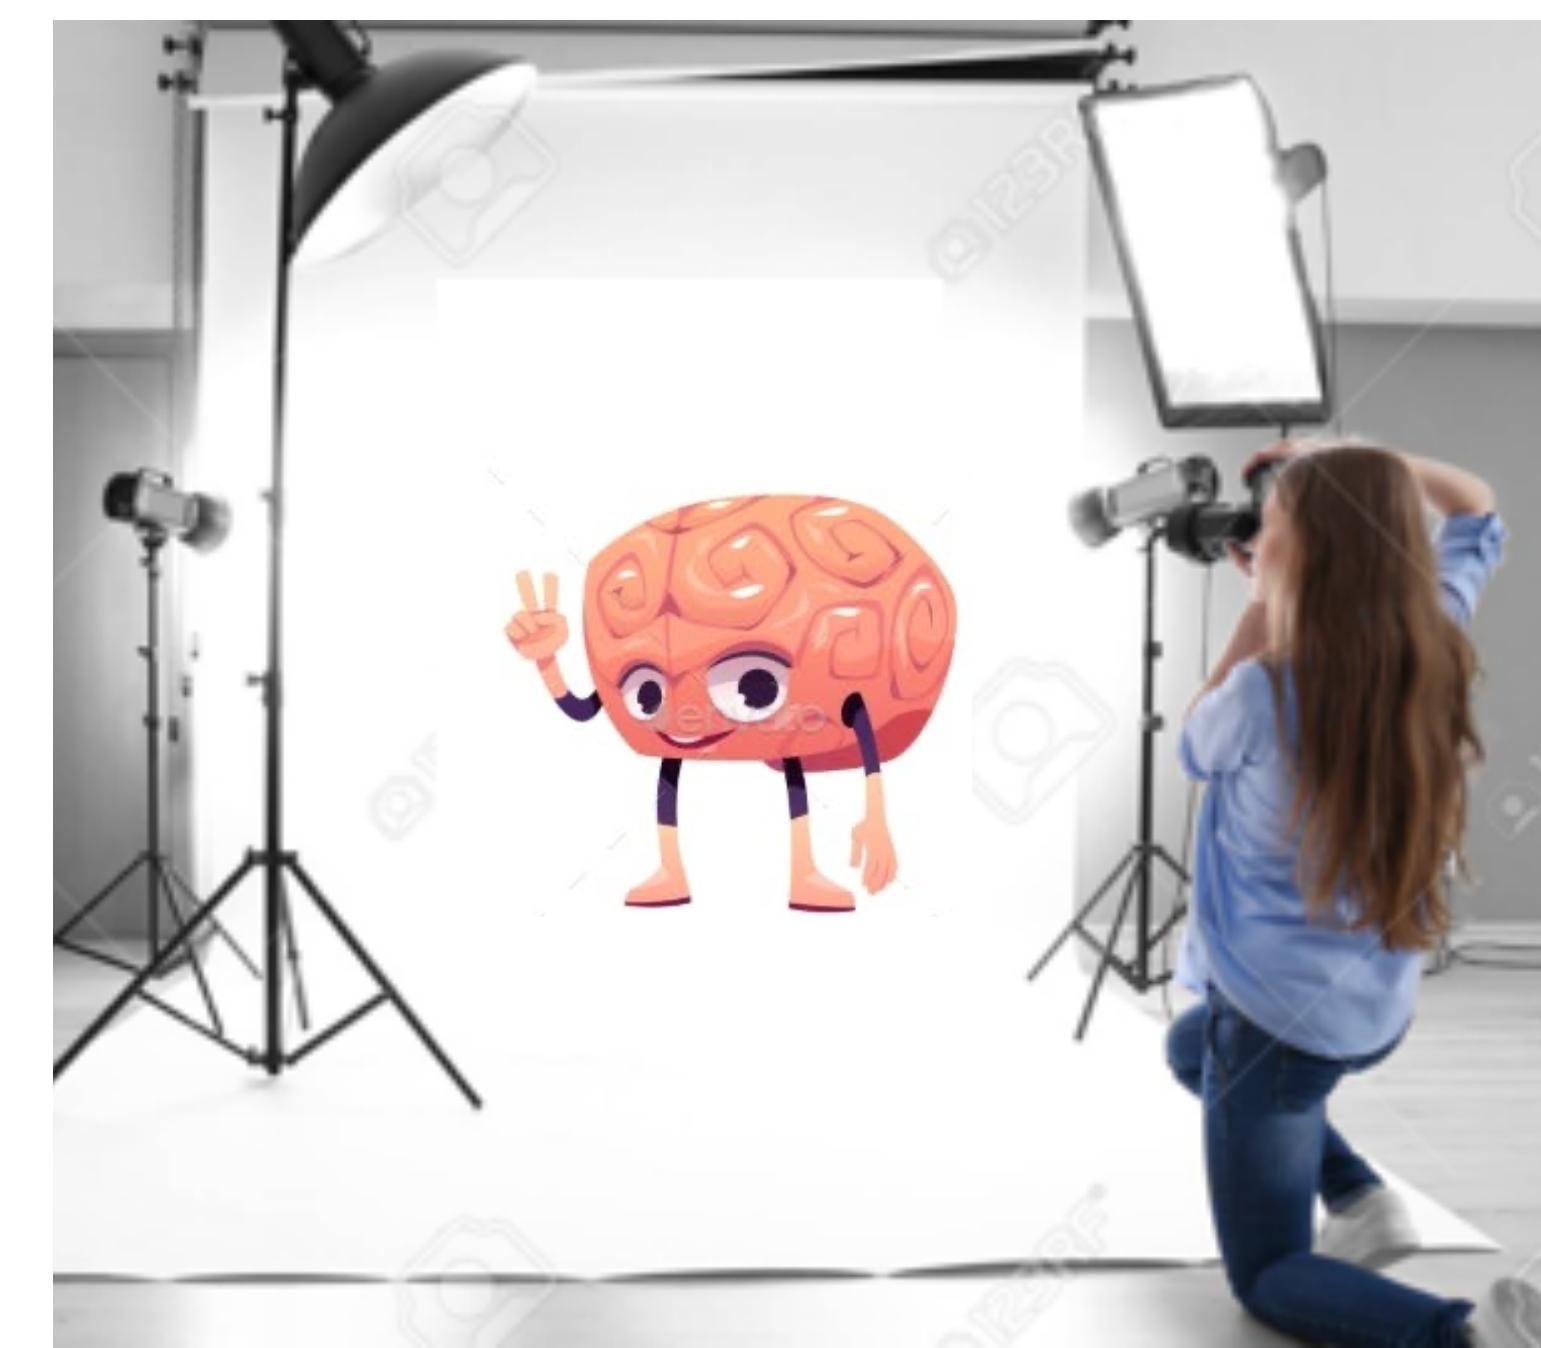

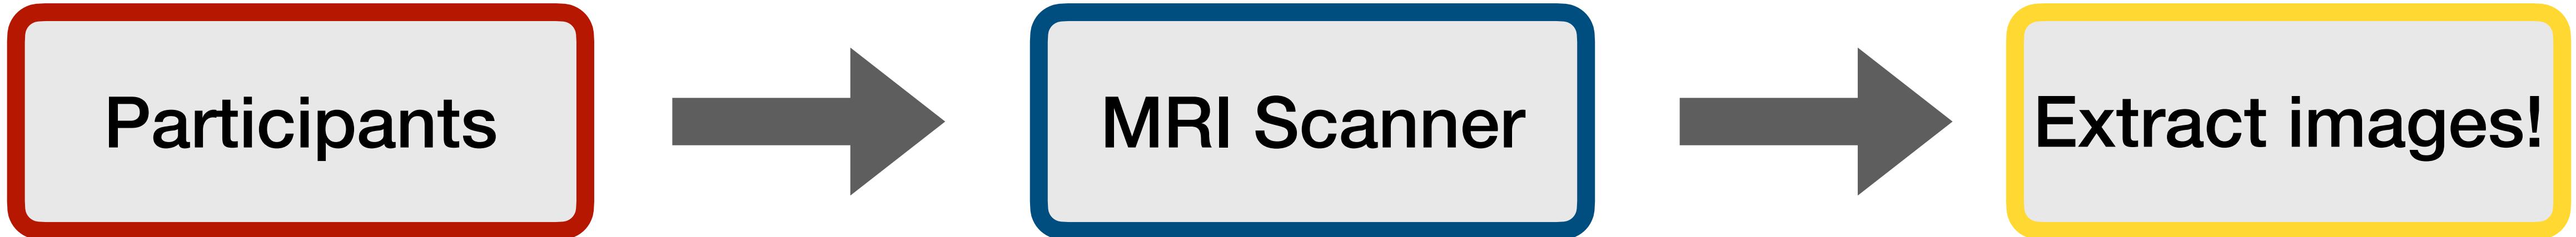

**11 Novices**

# ***DISCUSSION QUESTION(S)!***

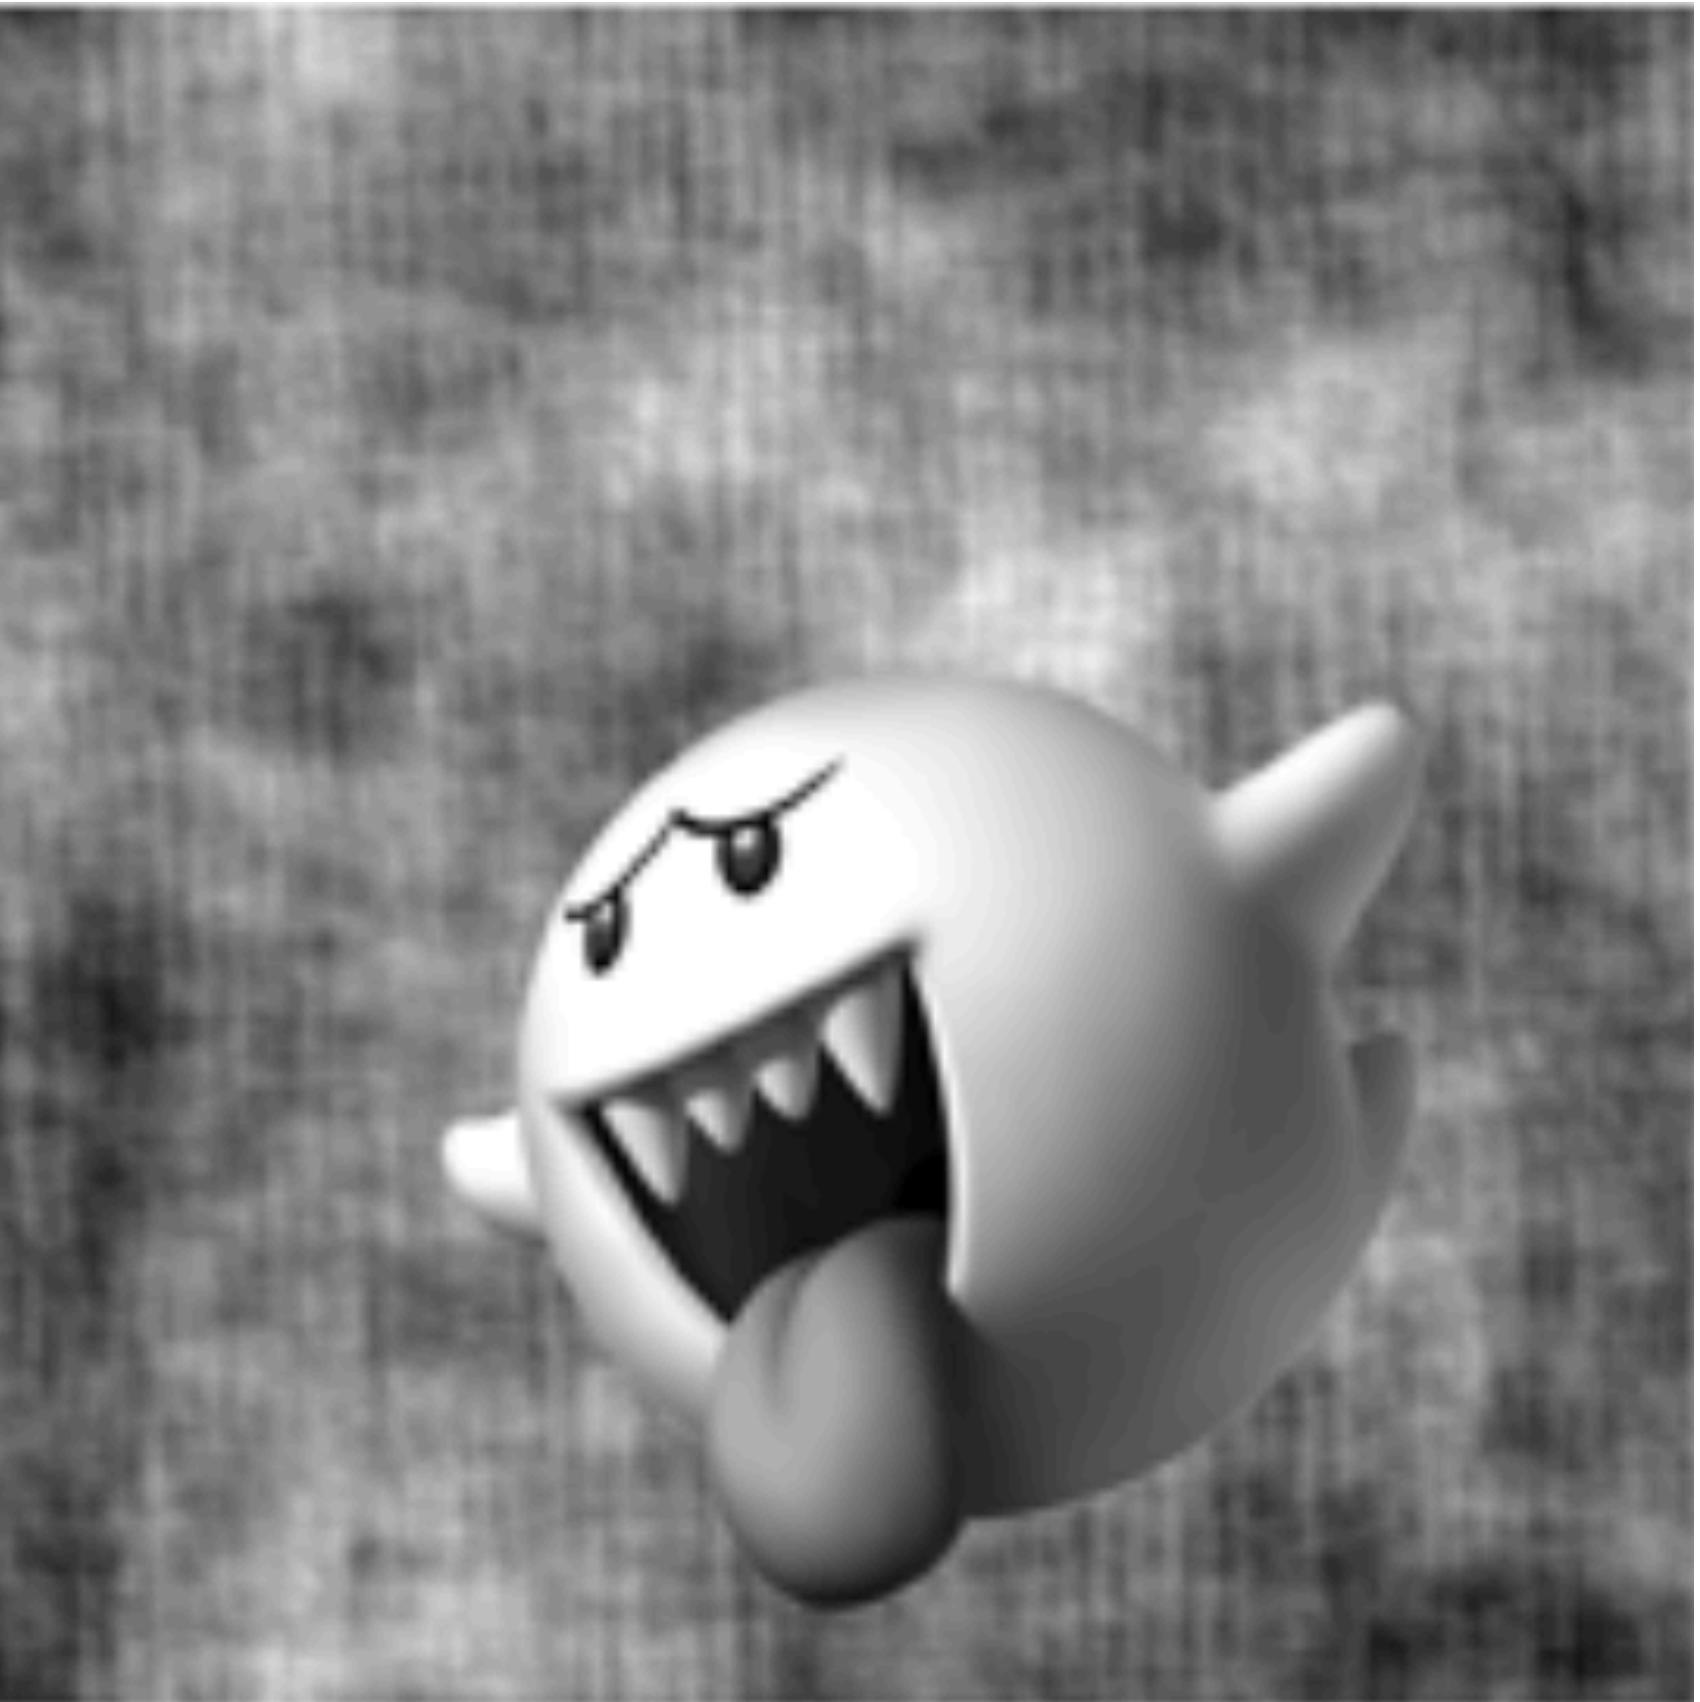

*How would you describe an “experienced” Pokemon participant? Is it the video game? Or is extensively watching of the cartoon show and/or card games a component to consider as well?*

# Experimental Design

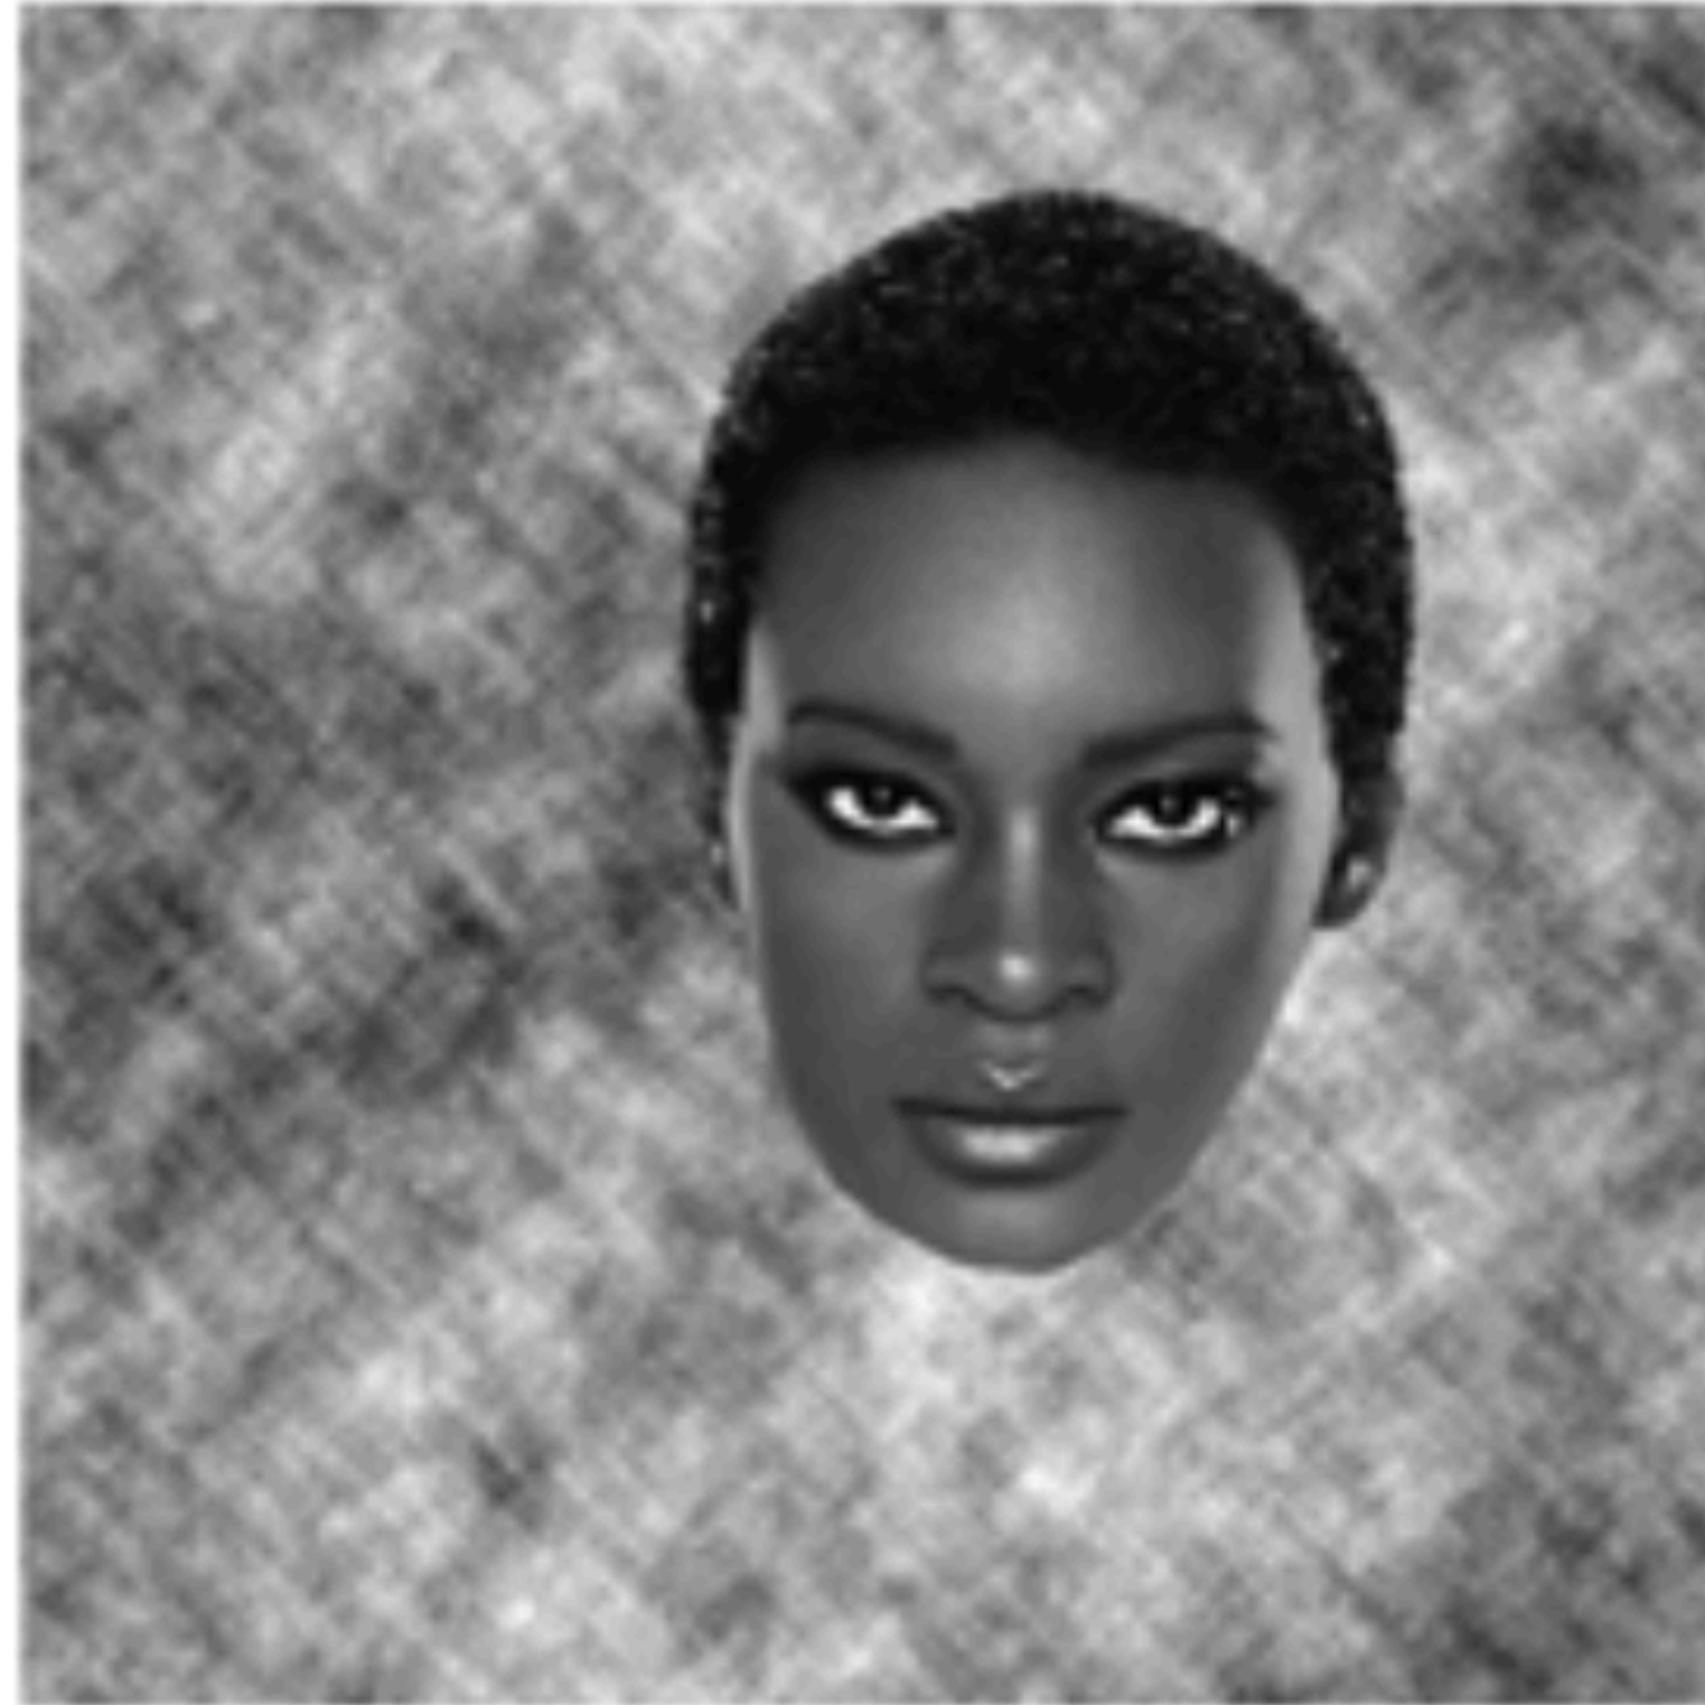

POKEMON

CARTOON

ANIMAL

FACE

BODY

WORD

CAR

CORRIDOR

# Potential Outcomes: What could they see?

1

**Null Hypothesis:** Pokemon will not elicit a consistent response pattern in the VTC in any group and will not correlate with any other category

2

**Animate Hypothesis:** Pokemon will correlate with animals, faces, and bodies since they bear some resemblance to these categories

3

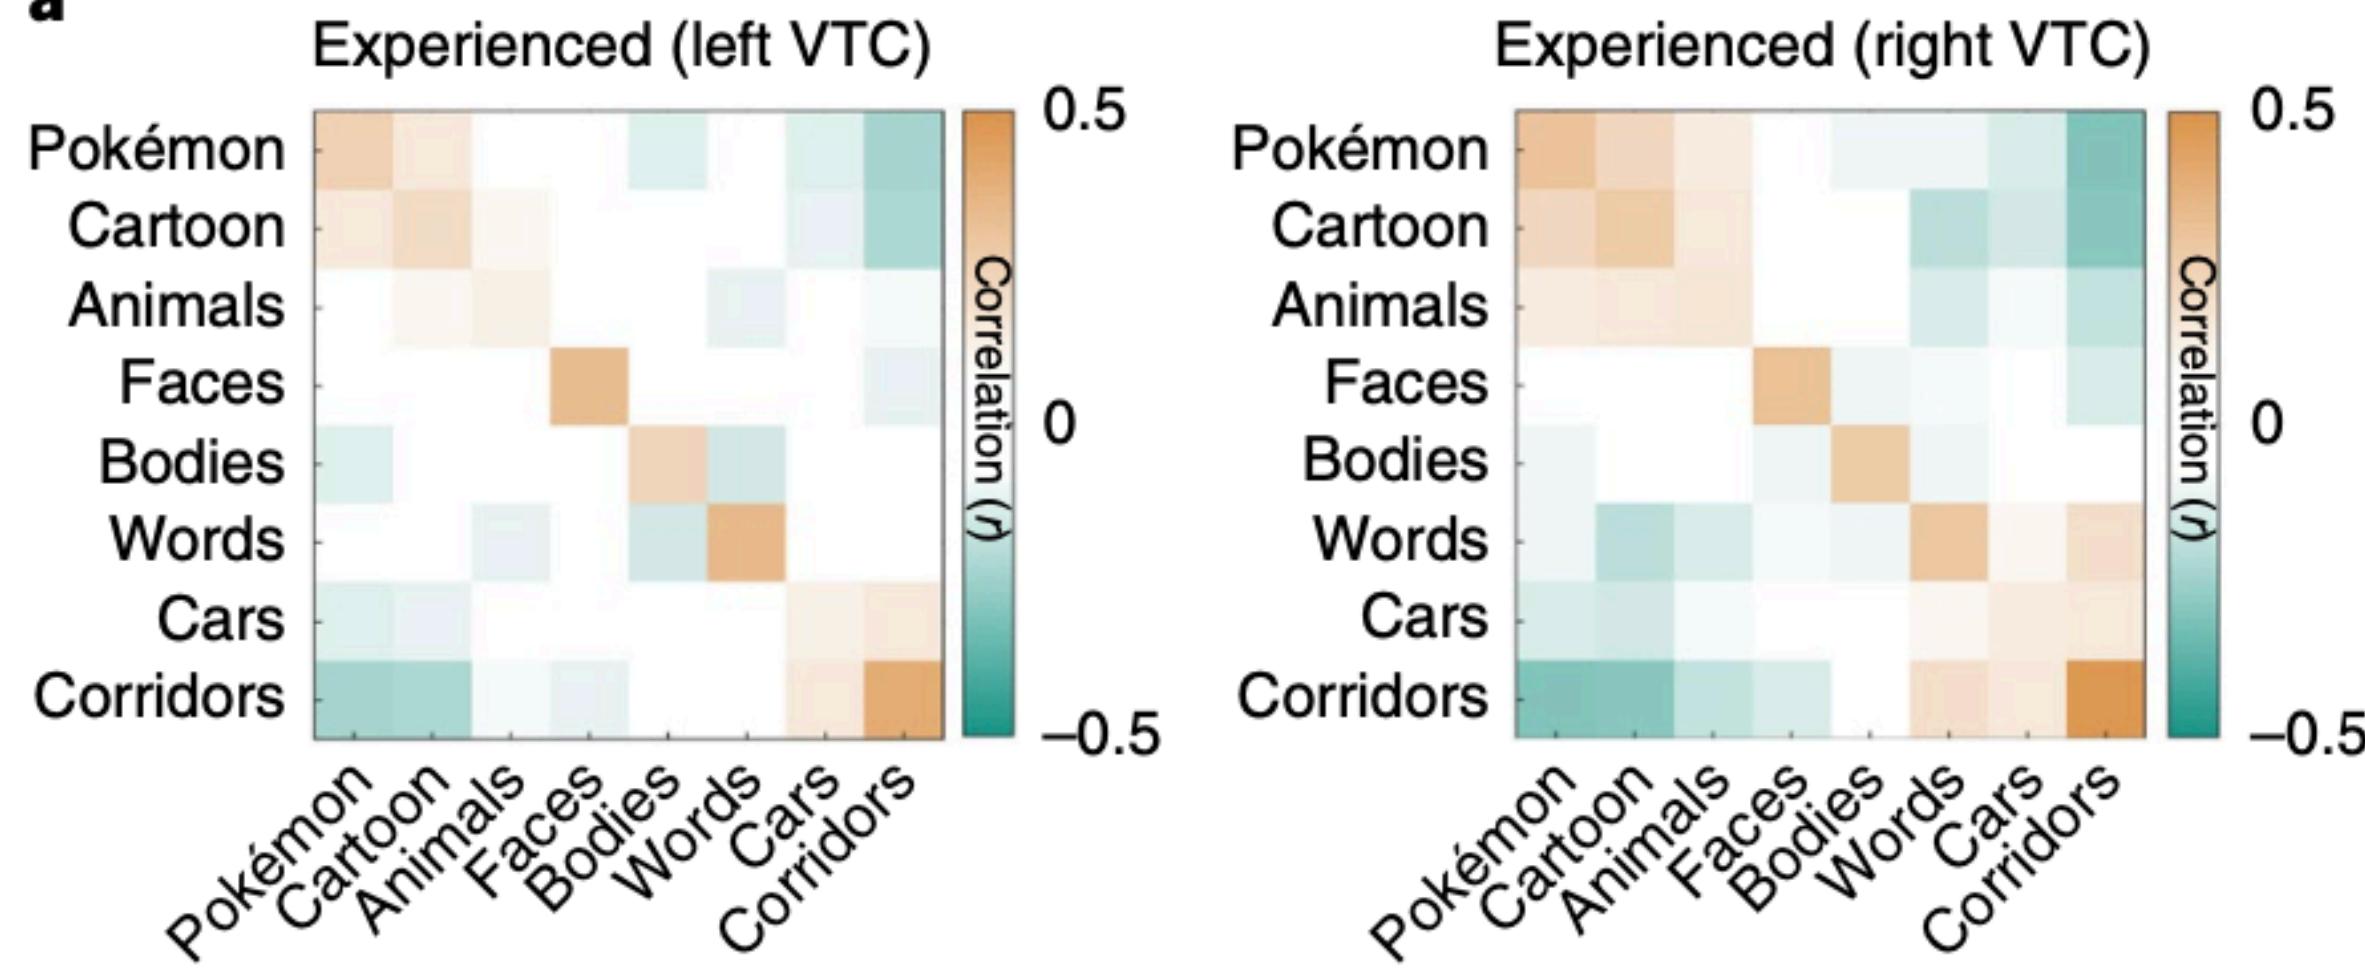

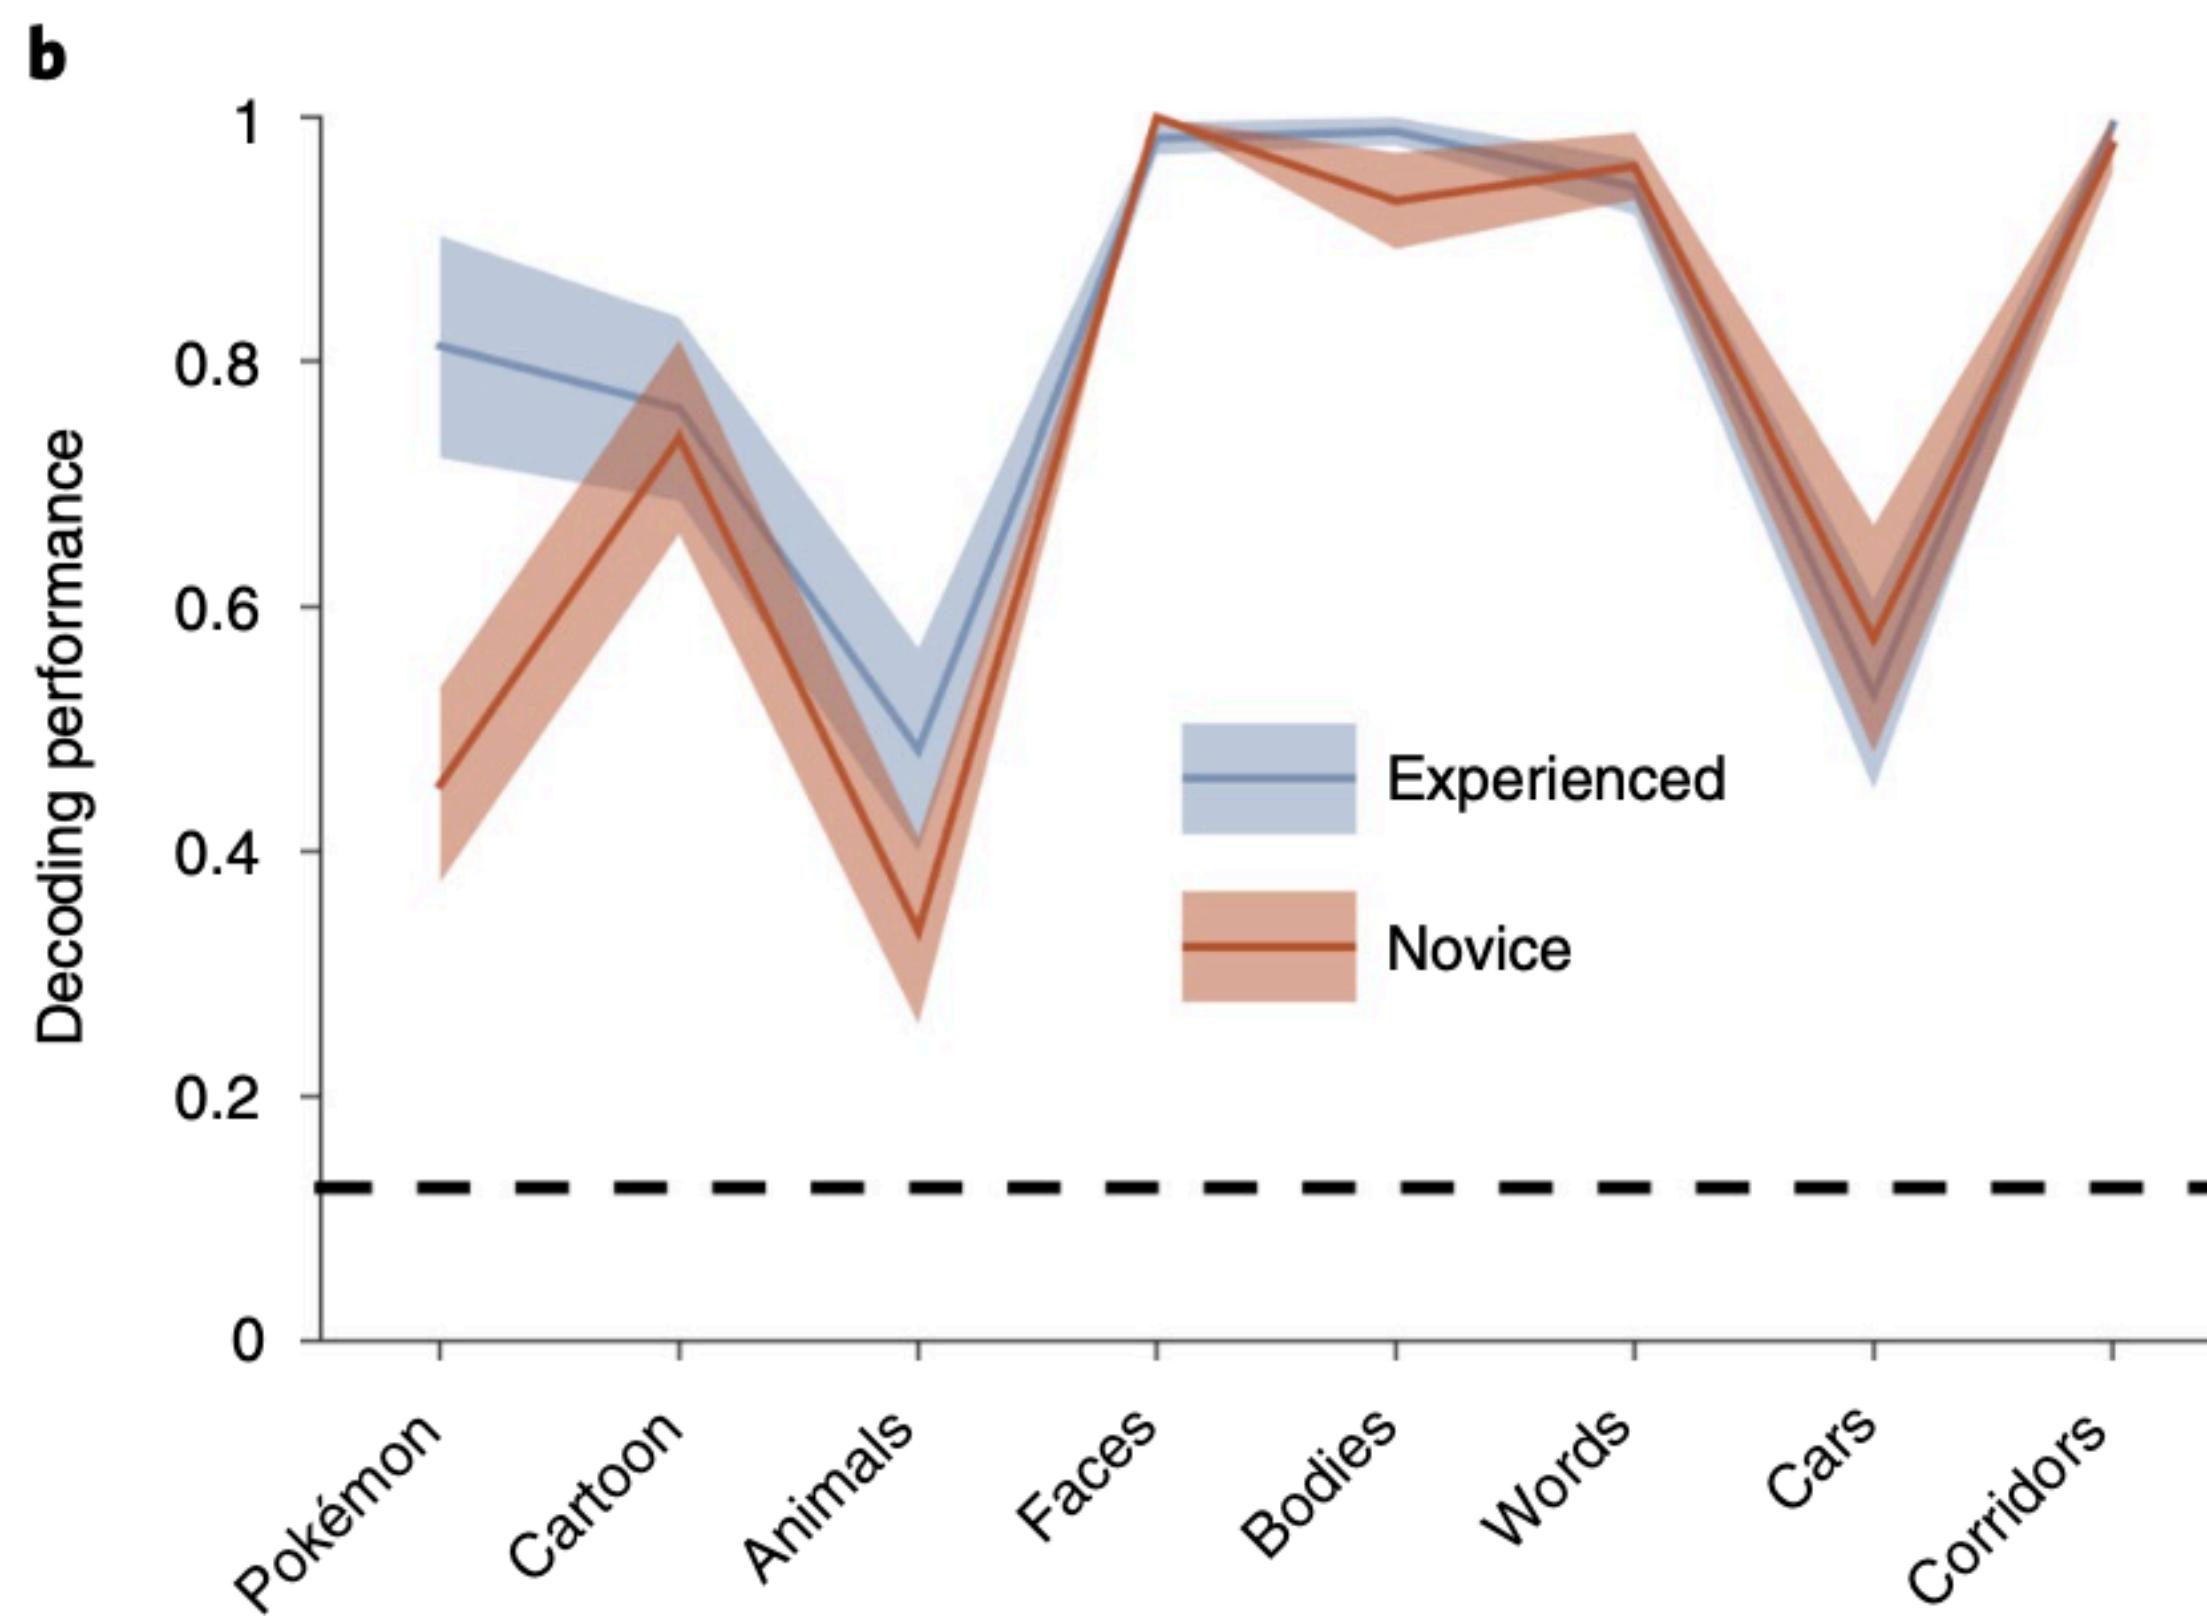

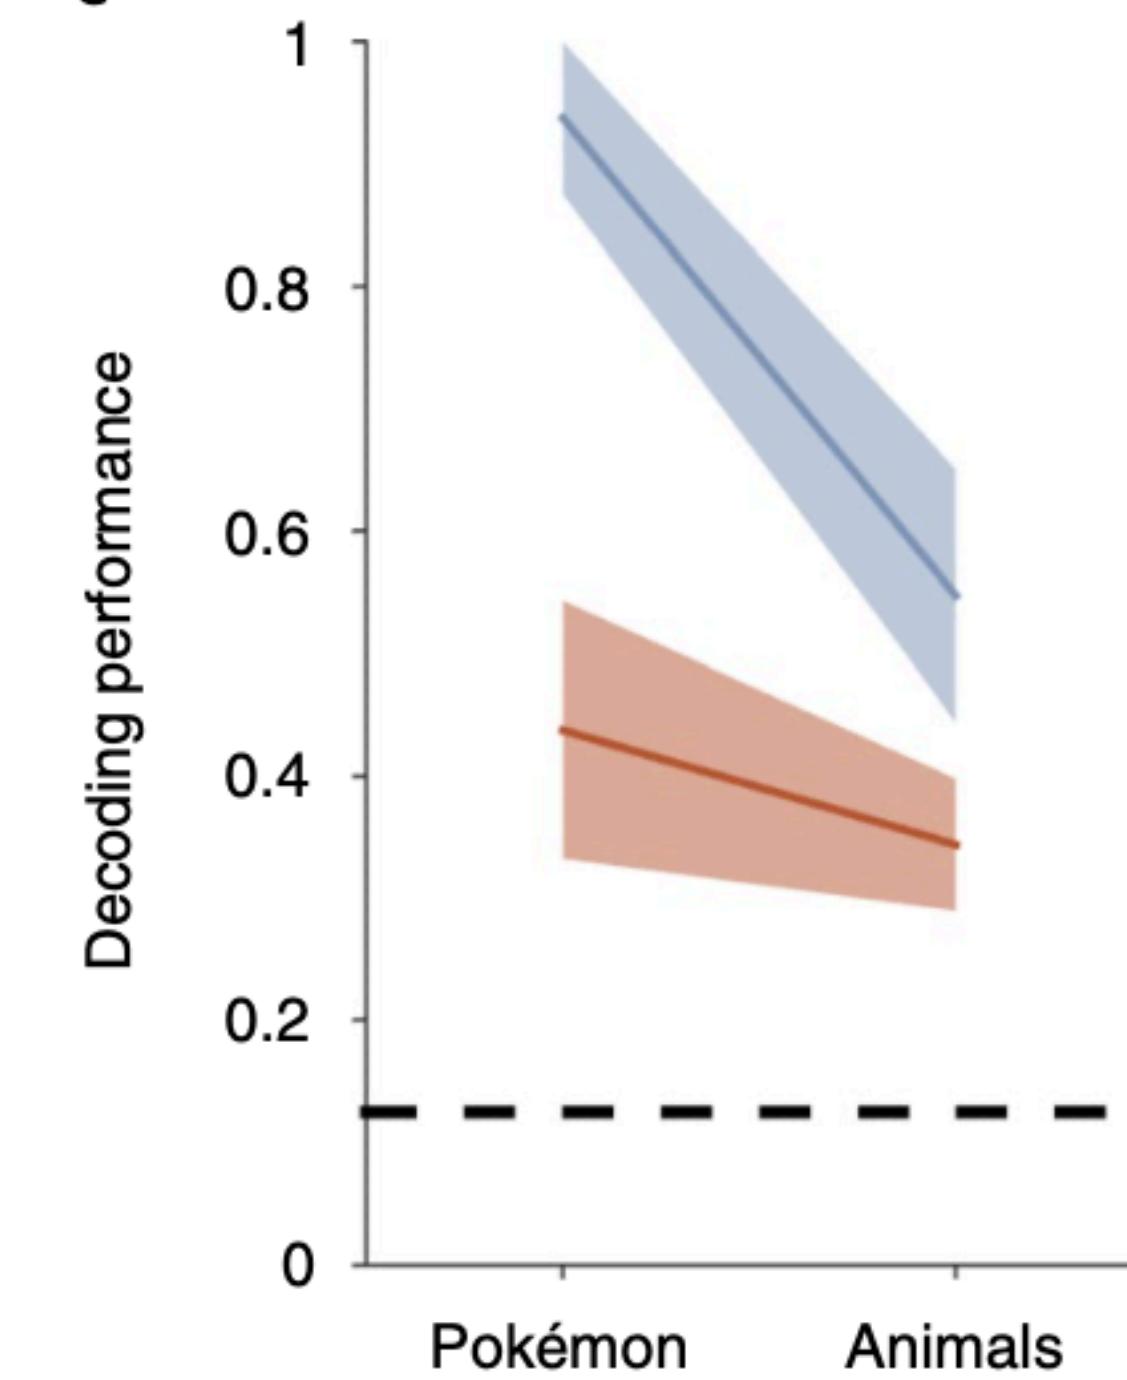

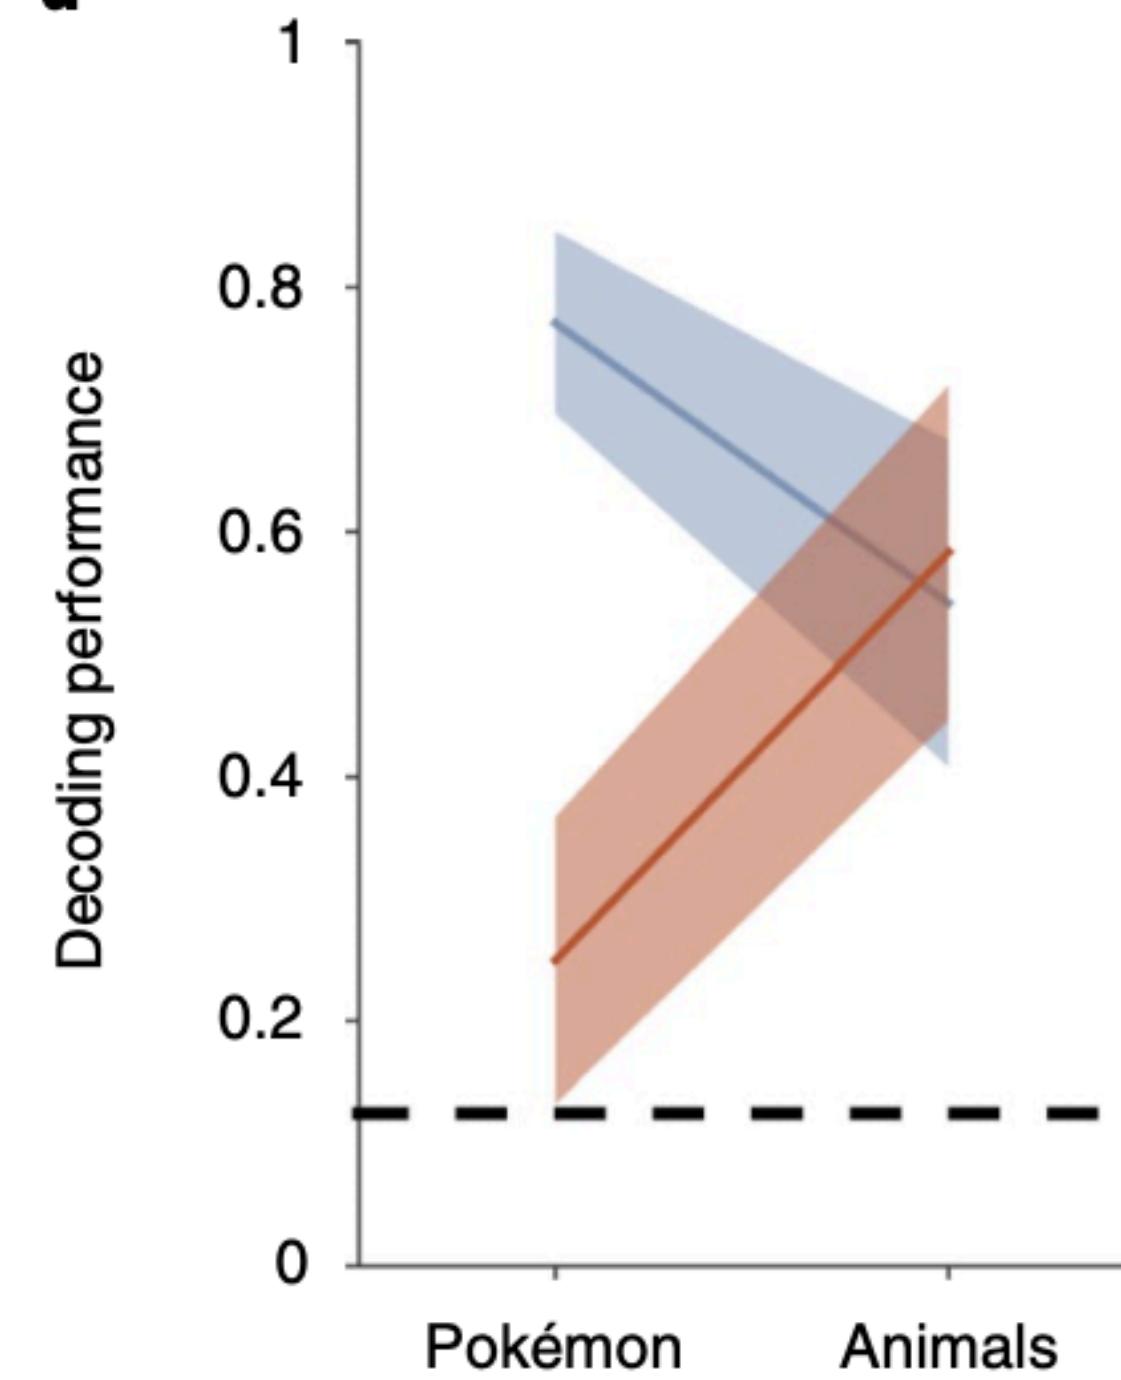

**Expertise Hypothesis:** Stimuli someone acquires expertise on will be processed in face-selective regions (re: Greeble study)

4

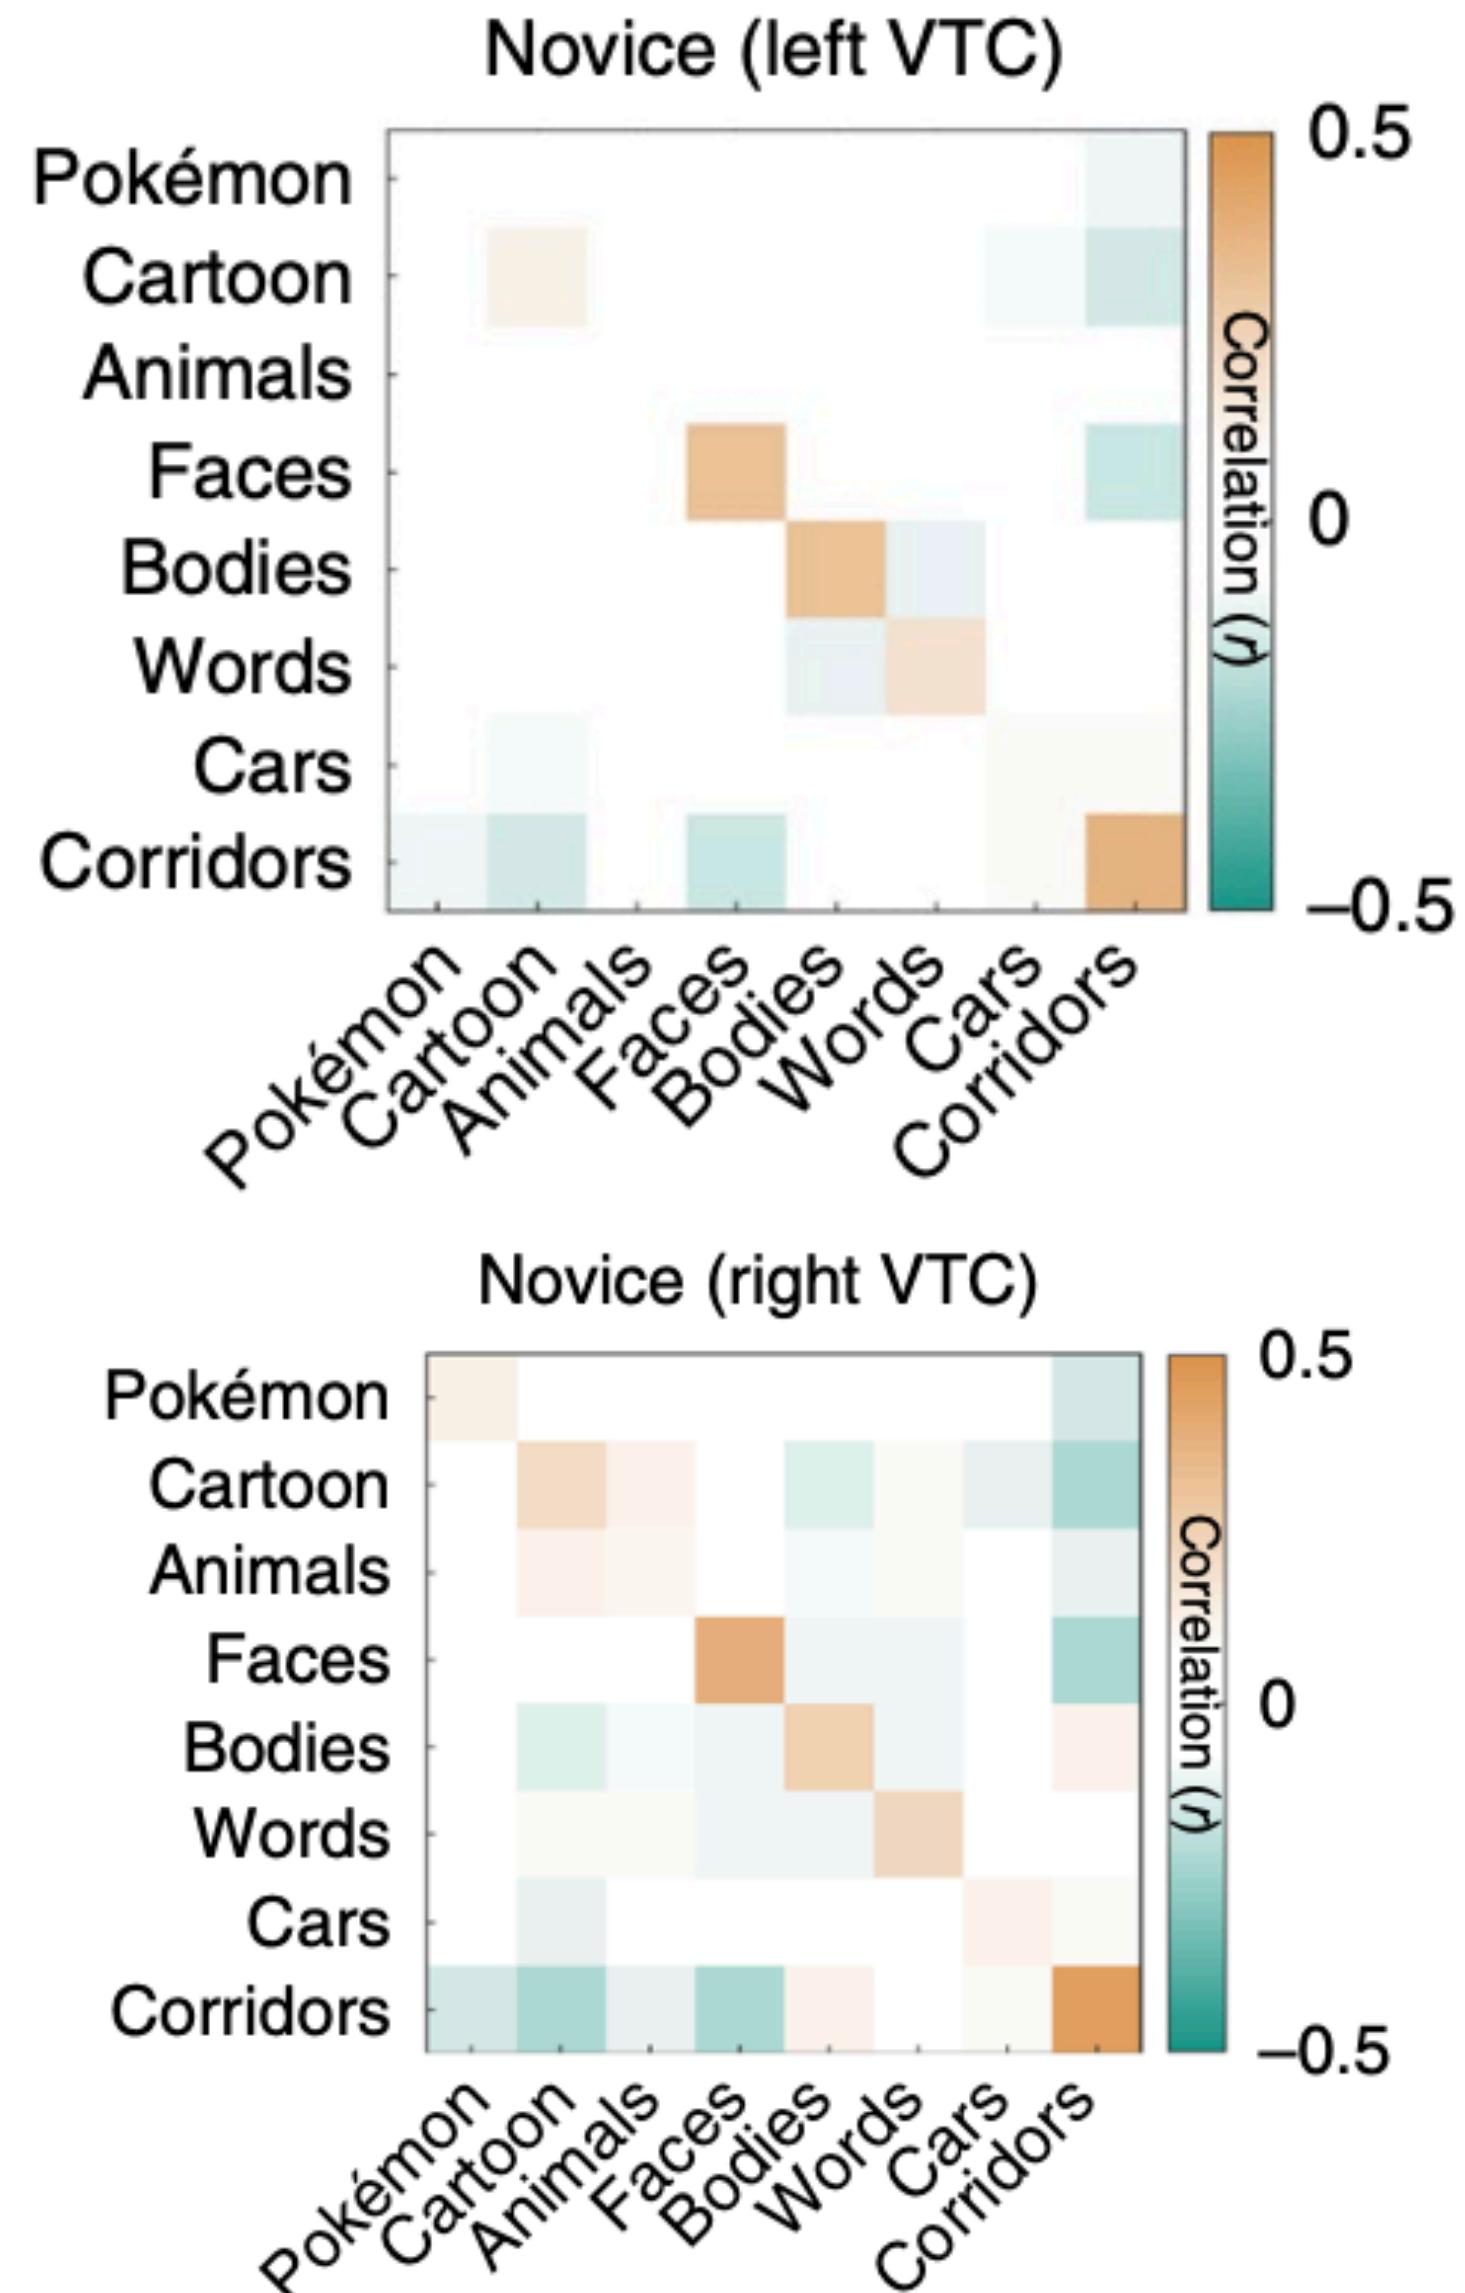

**Distinctiveness Hypothesis:** Pokemon constitute their own category and will elicit a unique response pattern

# Results

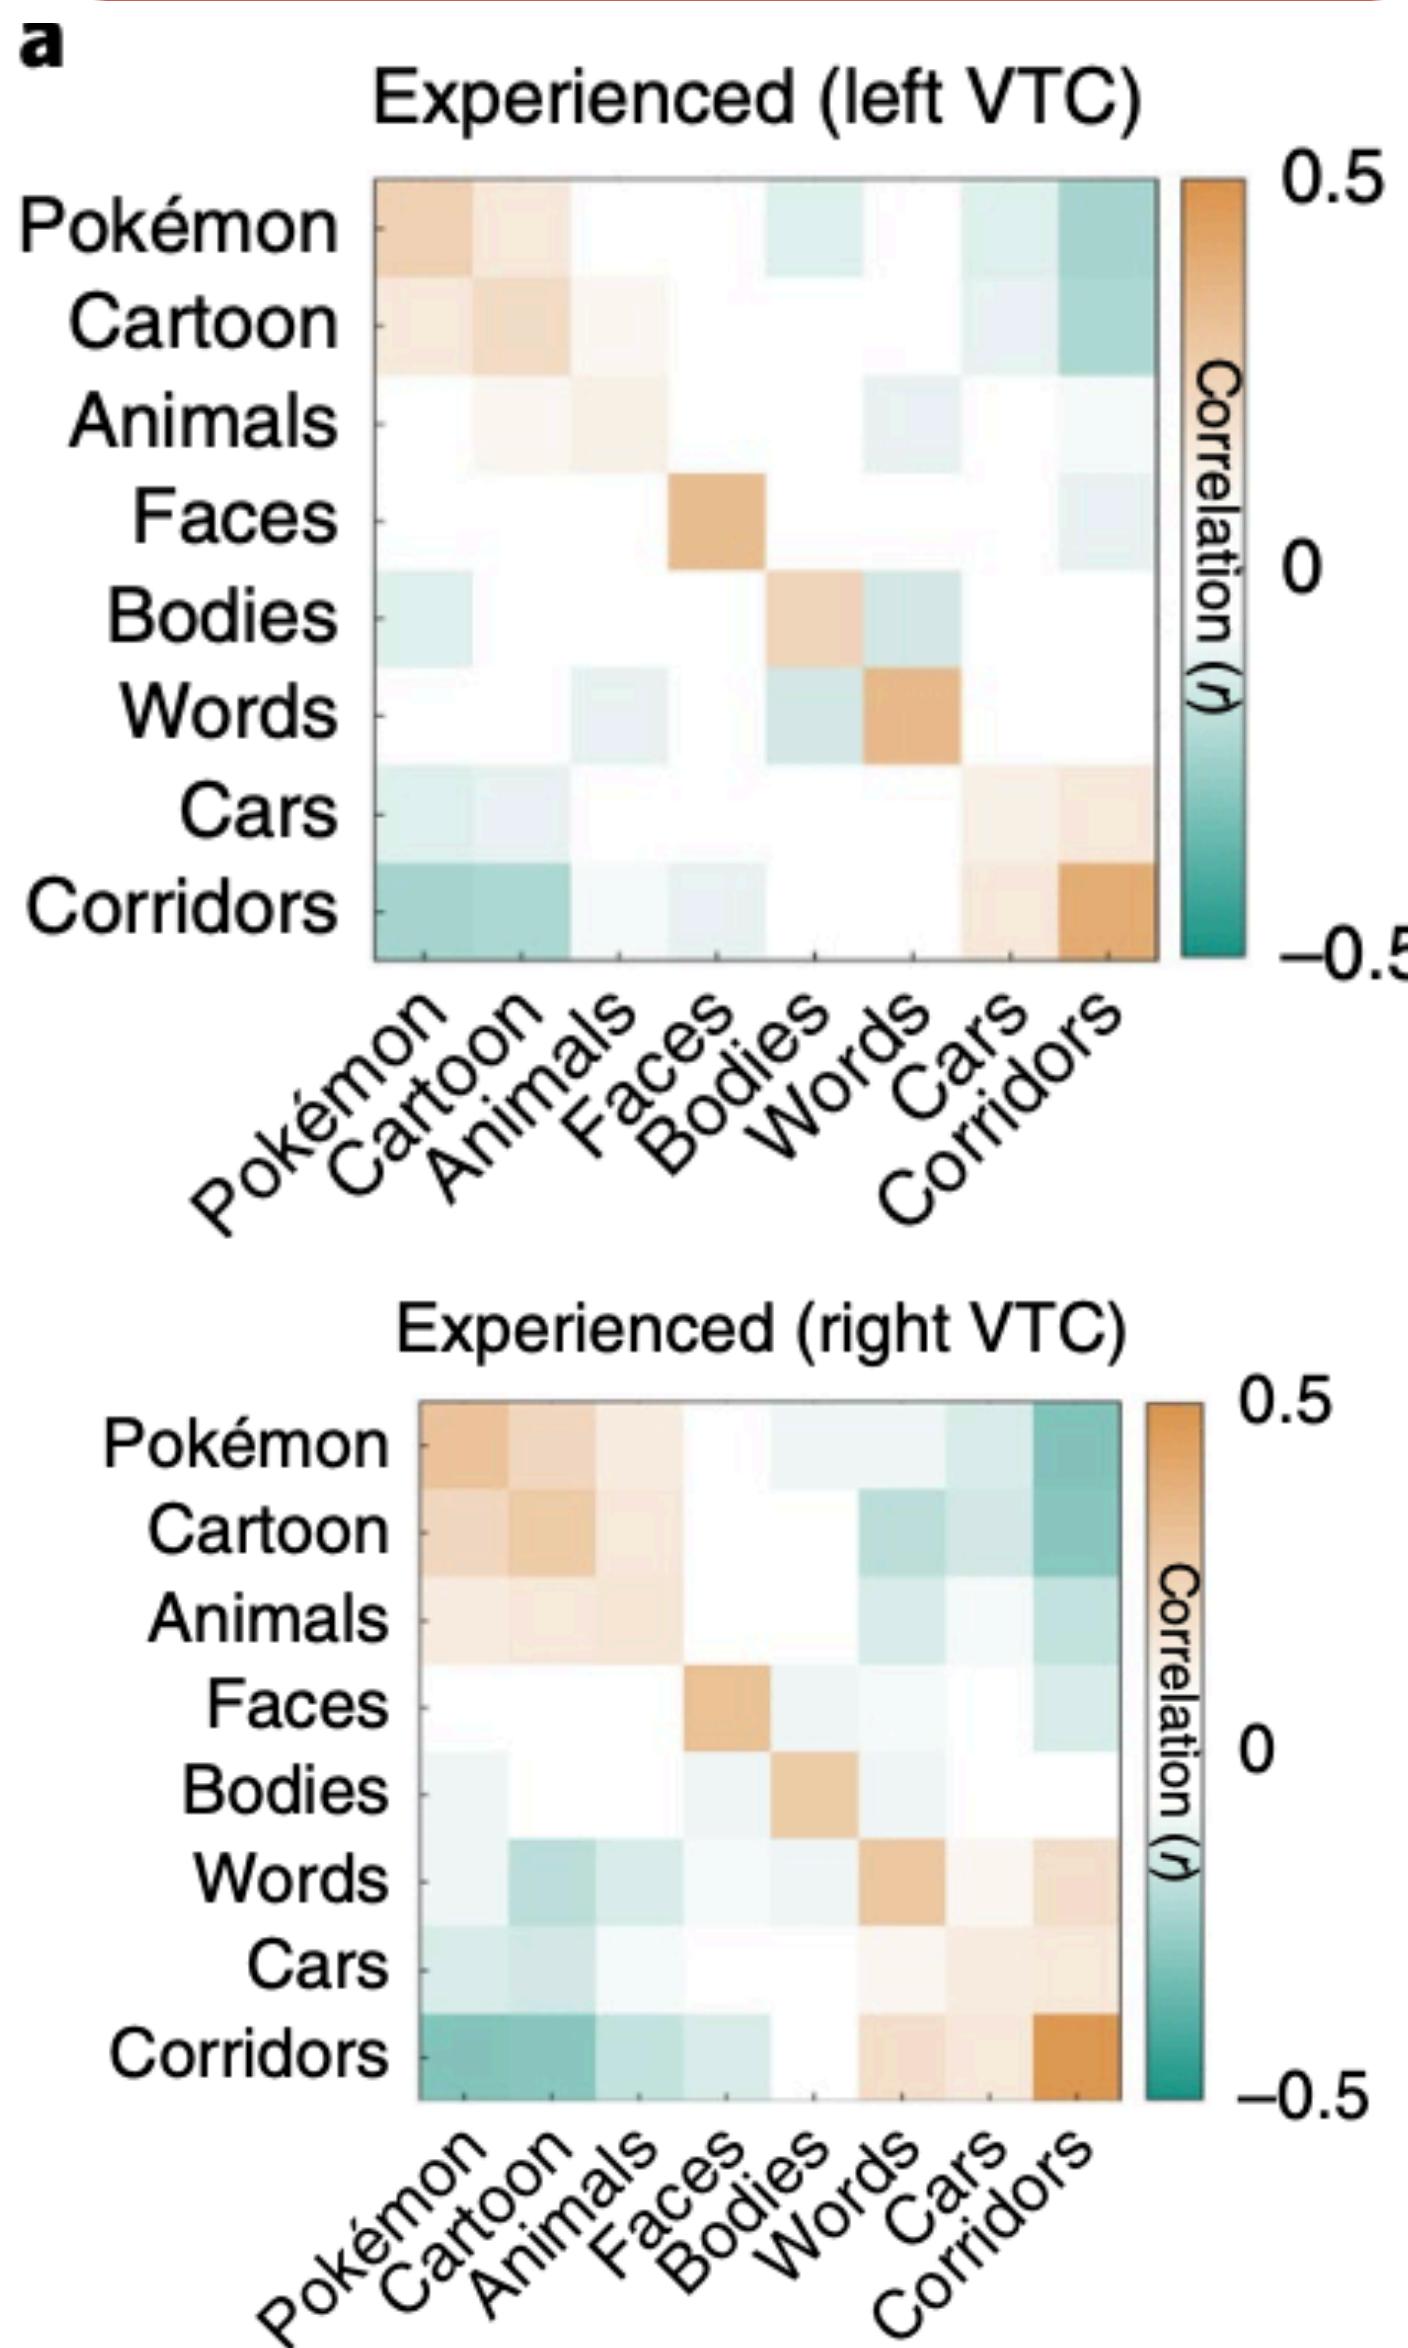

**a****b****c****d**

## Pokemon Novices

## Pokemon Experts

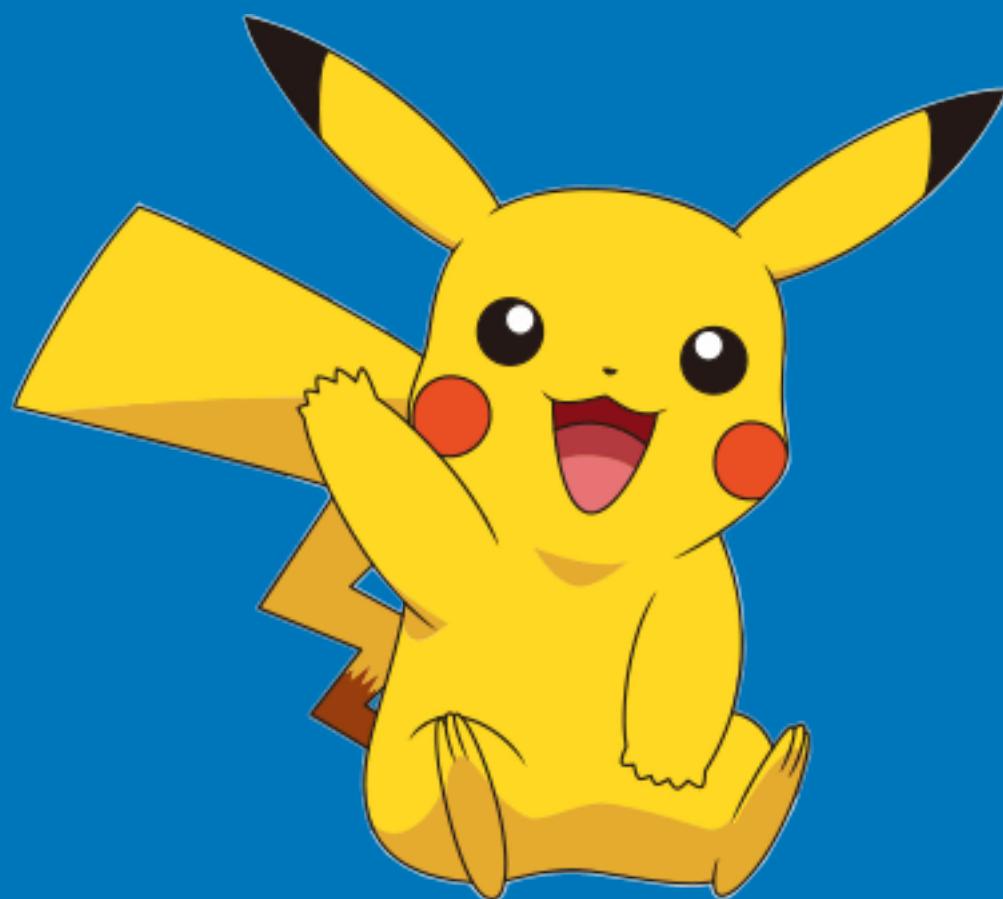

**Null Hypothesis:** Pokemon will elicit a consistent response pattern in the VTC compared to other categories.

**Animal Hypothesis:** Animals will correlate with faces, bodies, and words, but not cars or corridors.

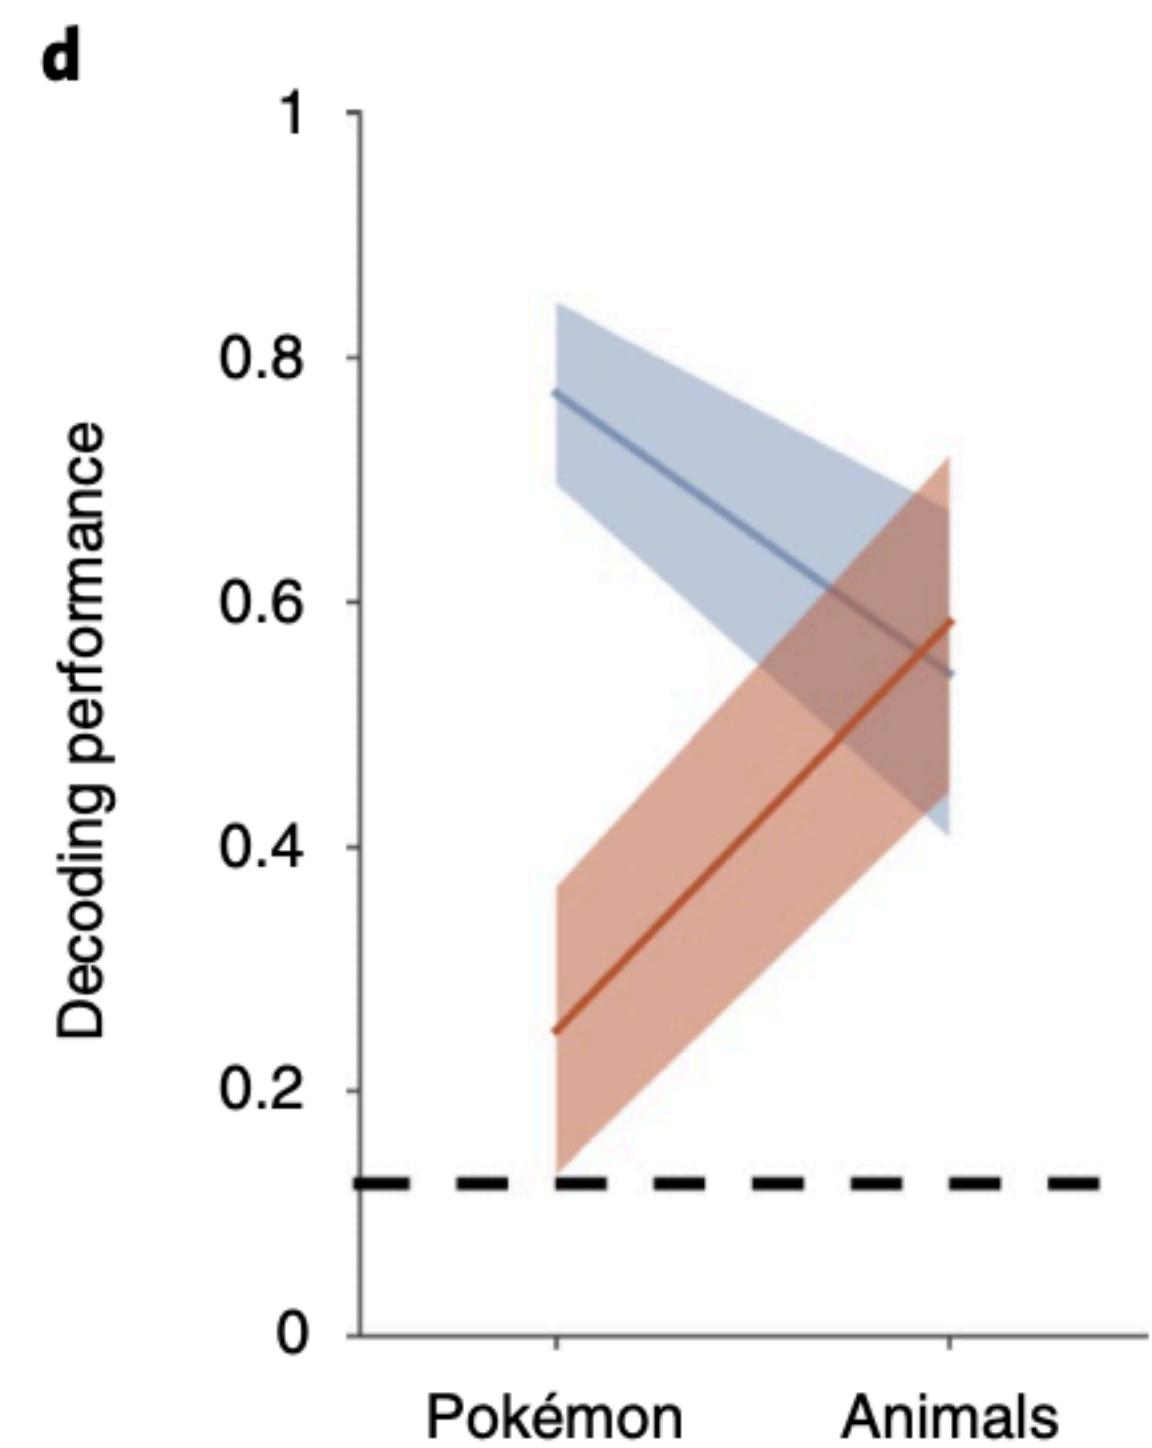

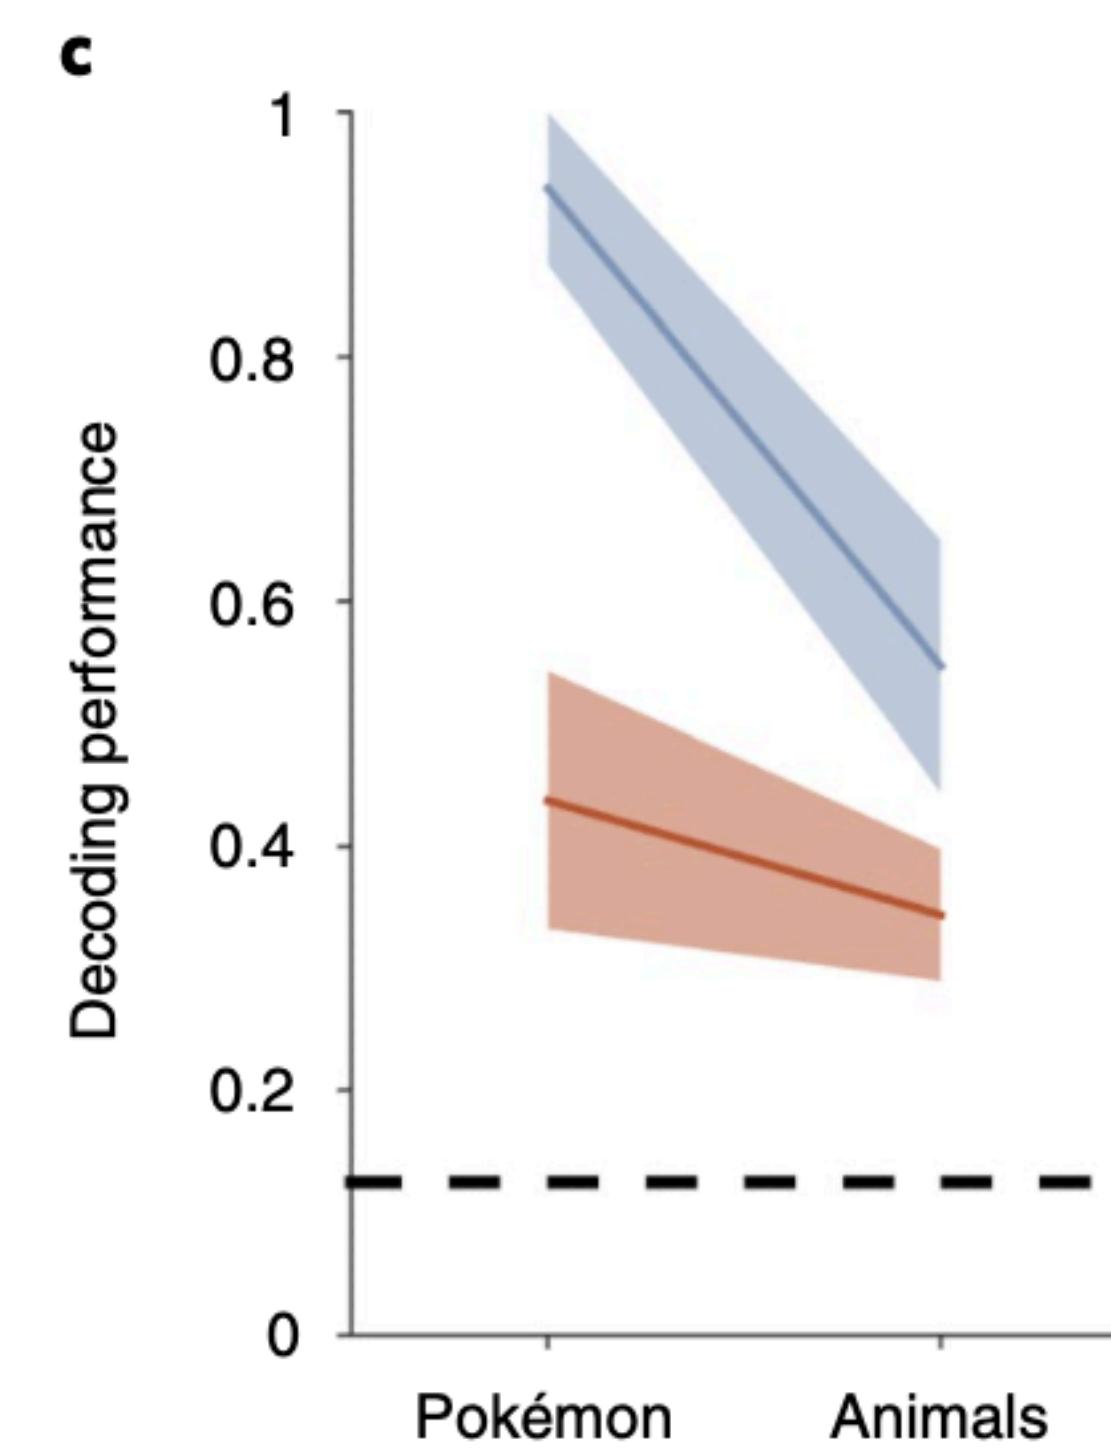

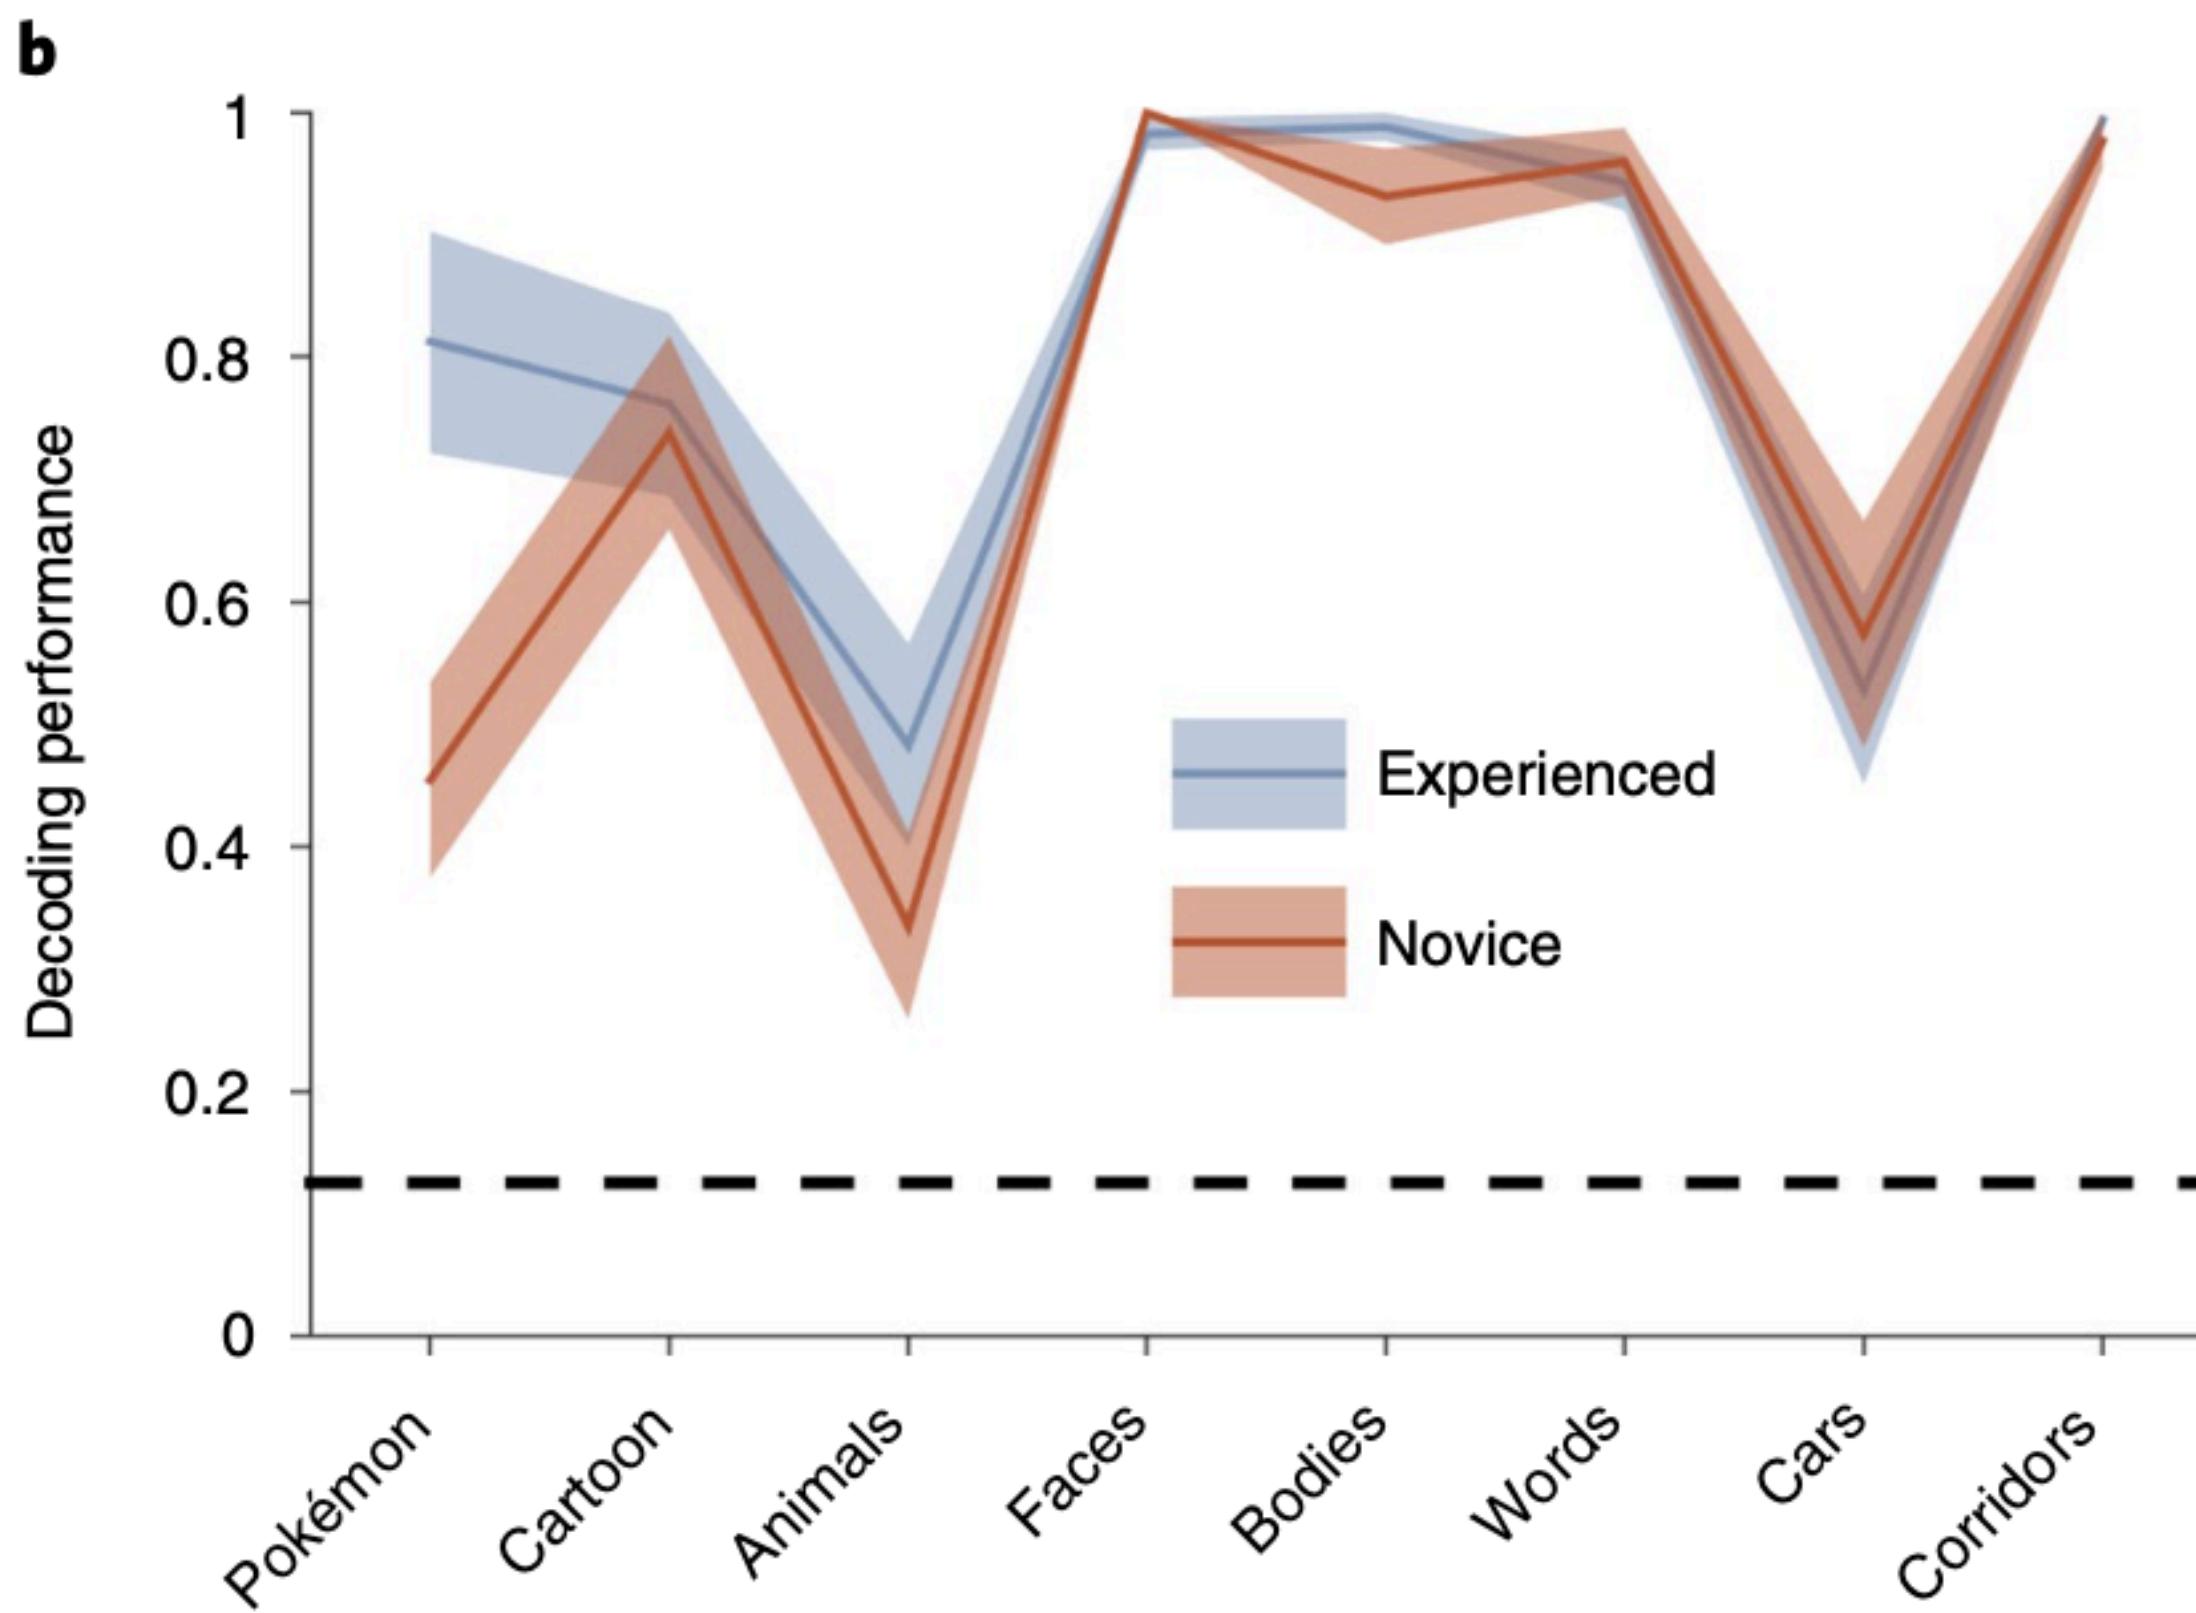

**Expert Hypothesis:** Experts will acquire expertise in faces, bodies, and words.

**Distinctiveness Hypothesis:** Pokemon constitute their own category and will elicit a unique response pattern.

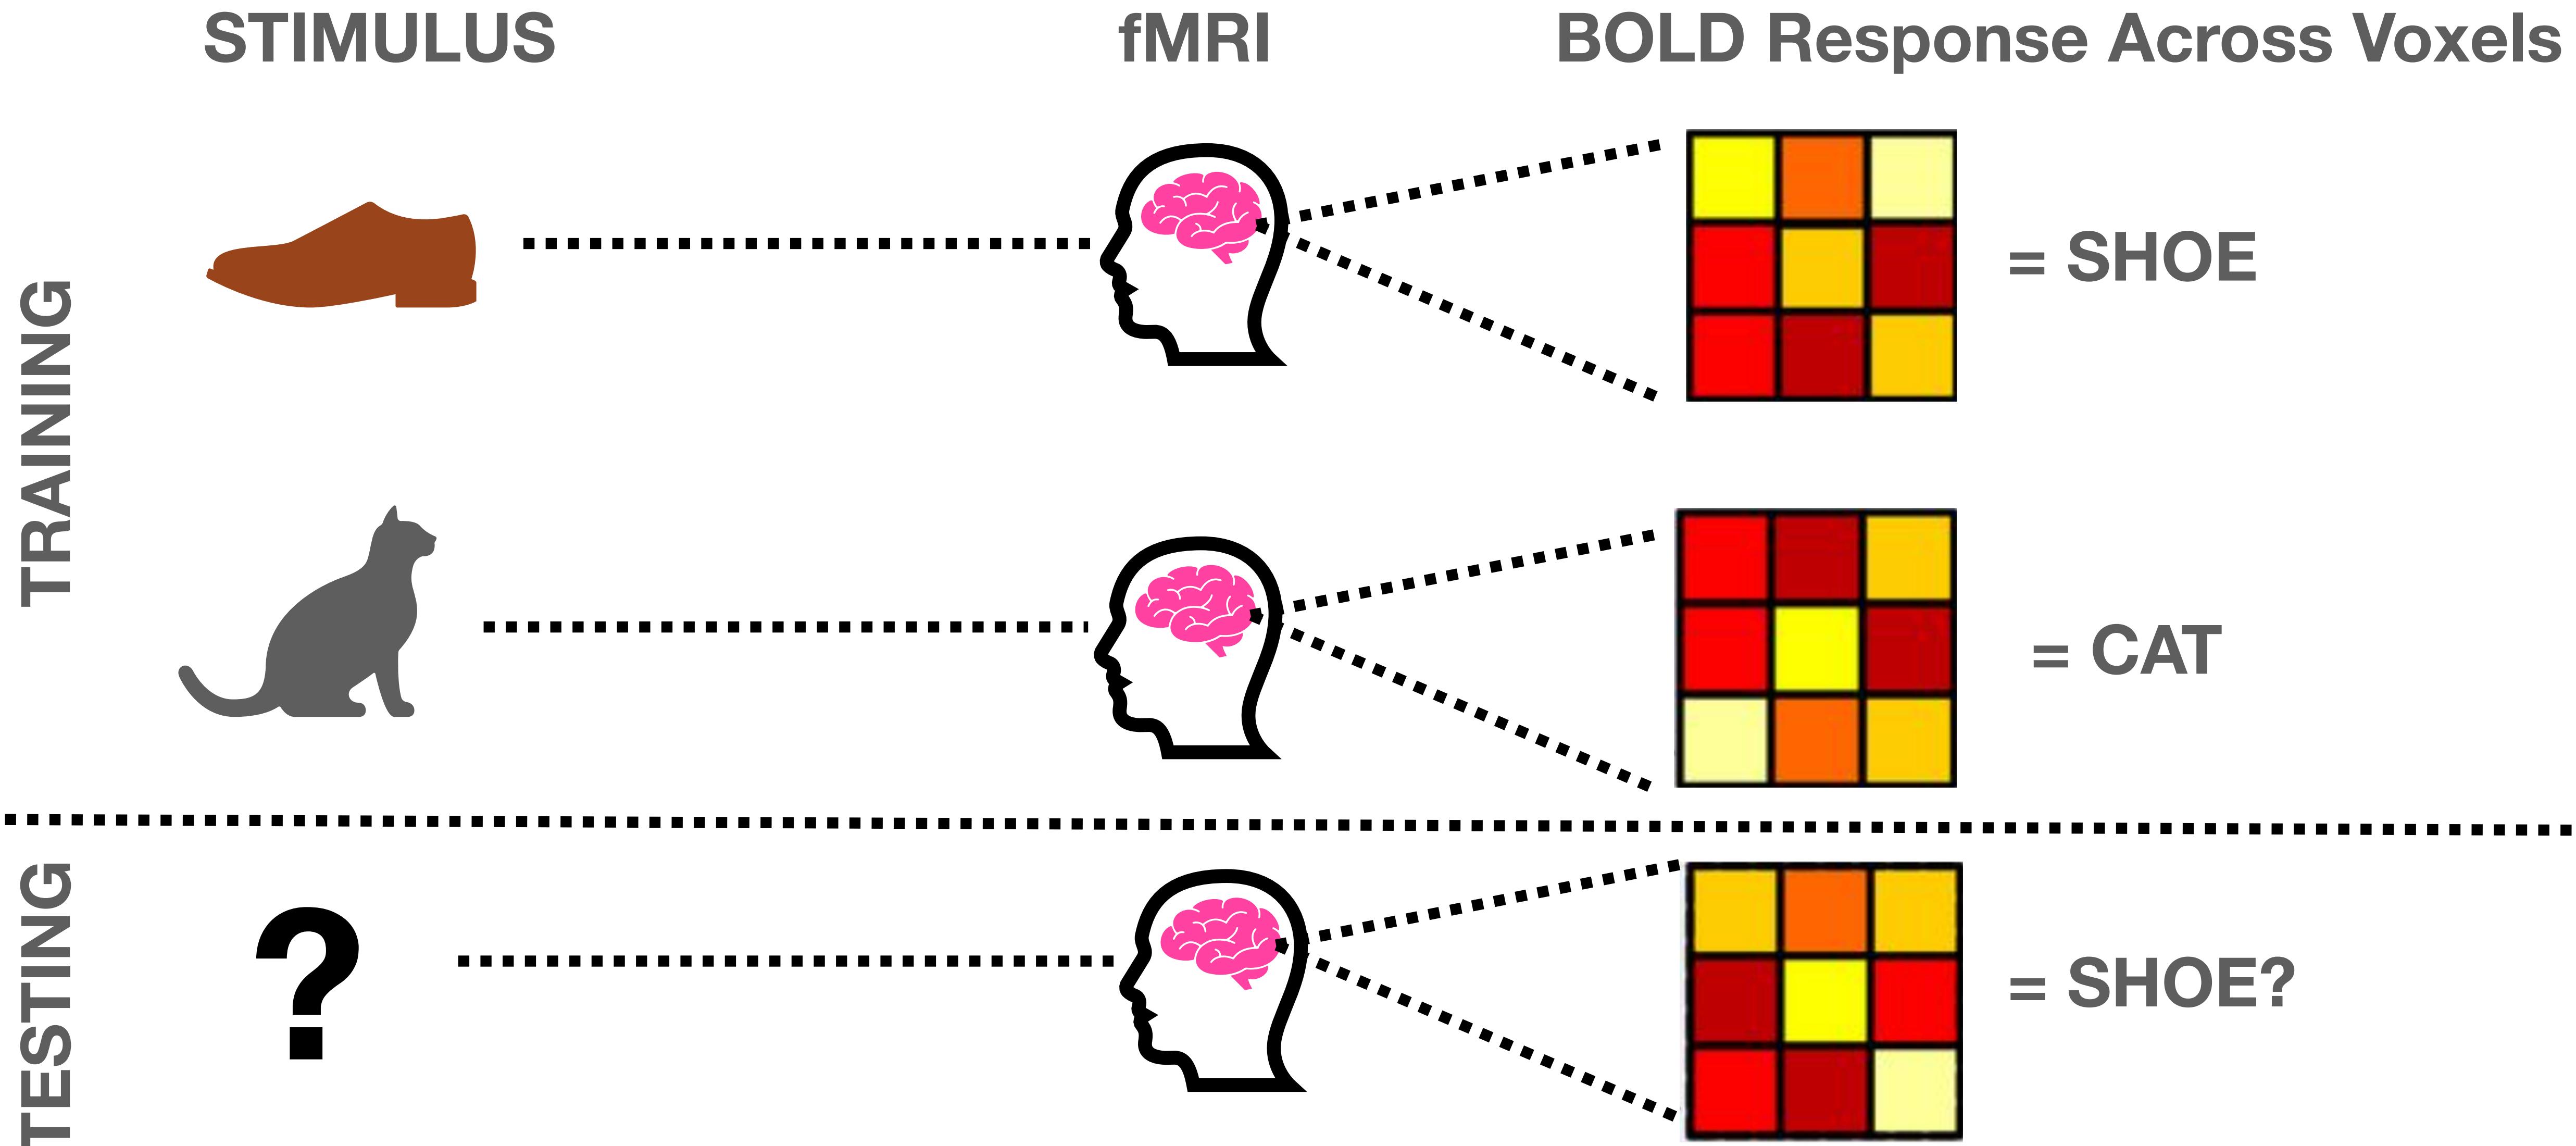

Distinctiveness hypothesis  
supported! Pokemon elicit  
their own unique response in  
experienced participants!

# What does this figure mean?

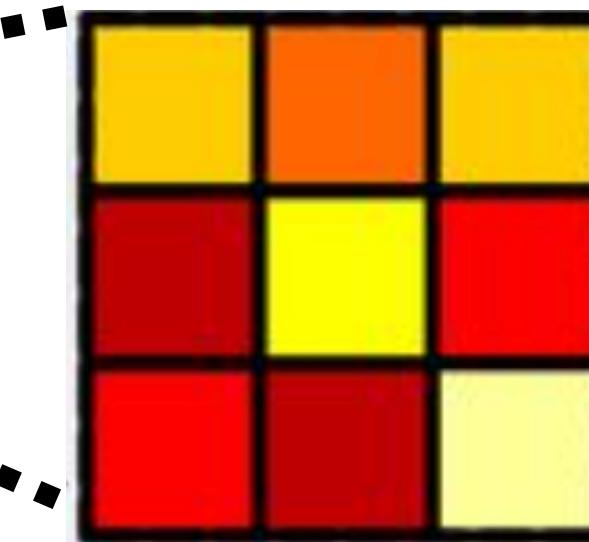

# What does neural decoding mean?

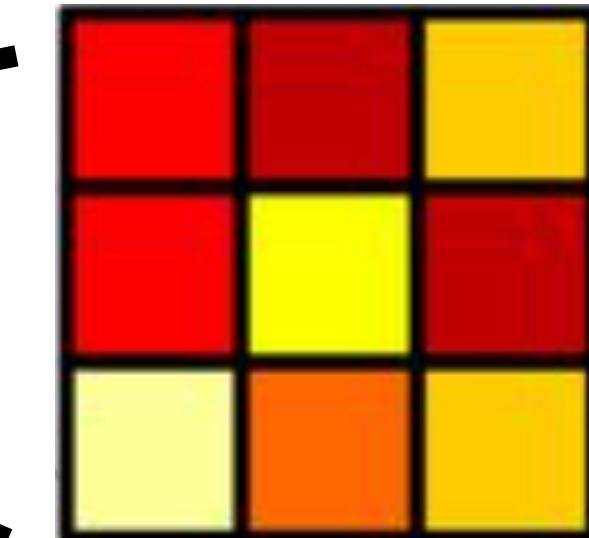

# Can you decode Pokemon stimuli?

TESTING

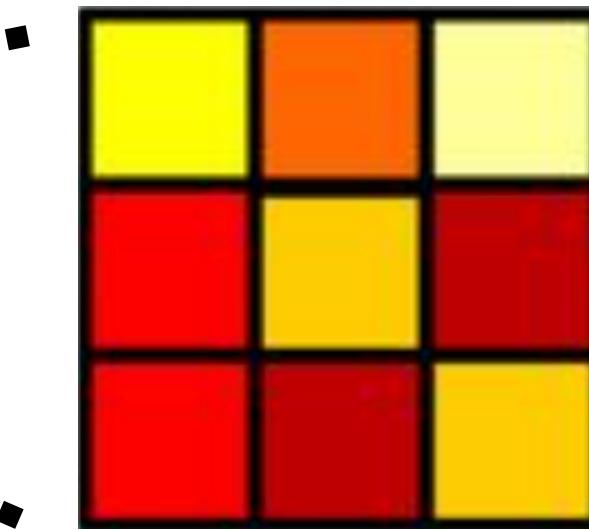

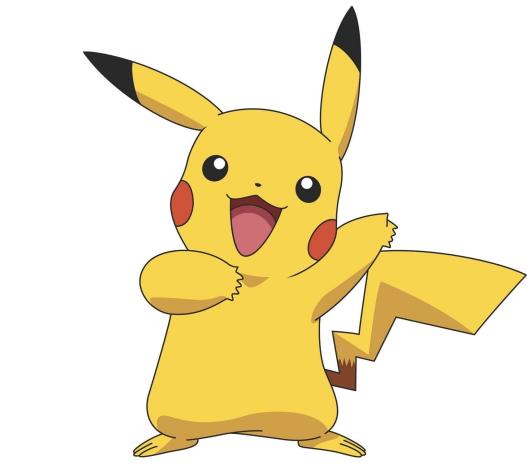

= POKEMON?

EXPERIENCE

= ANIMAL

= POKEMON

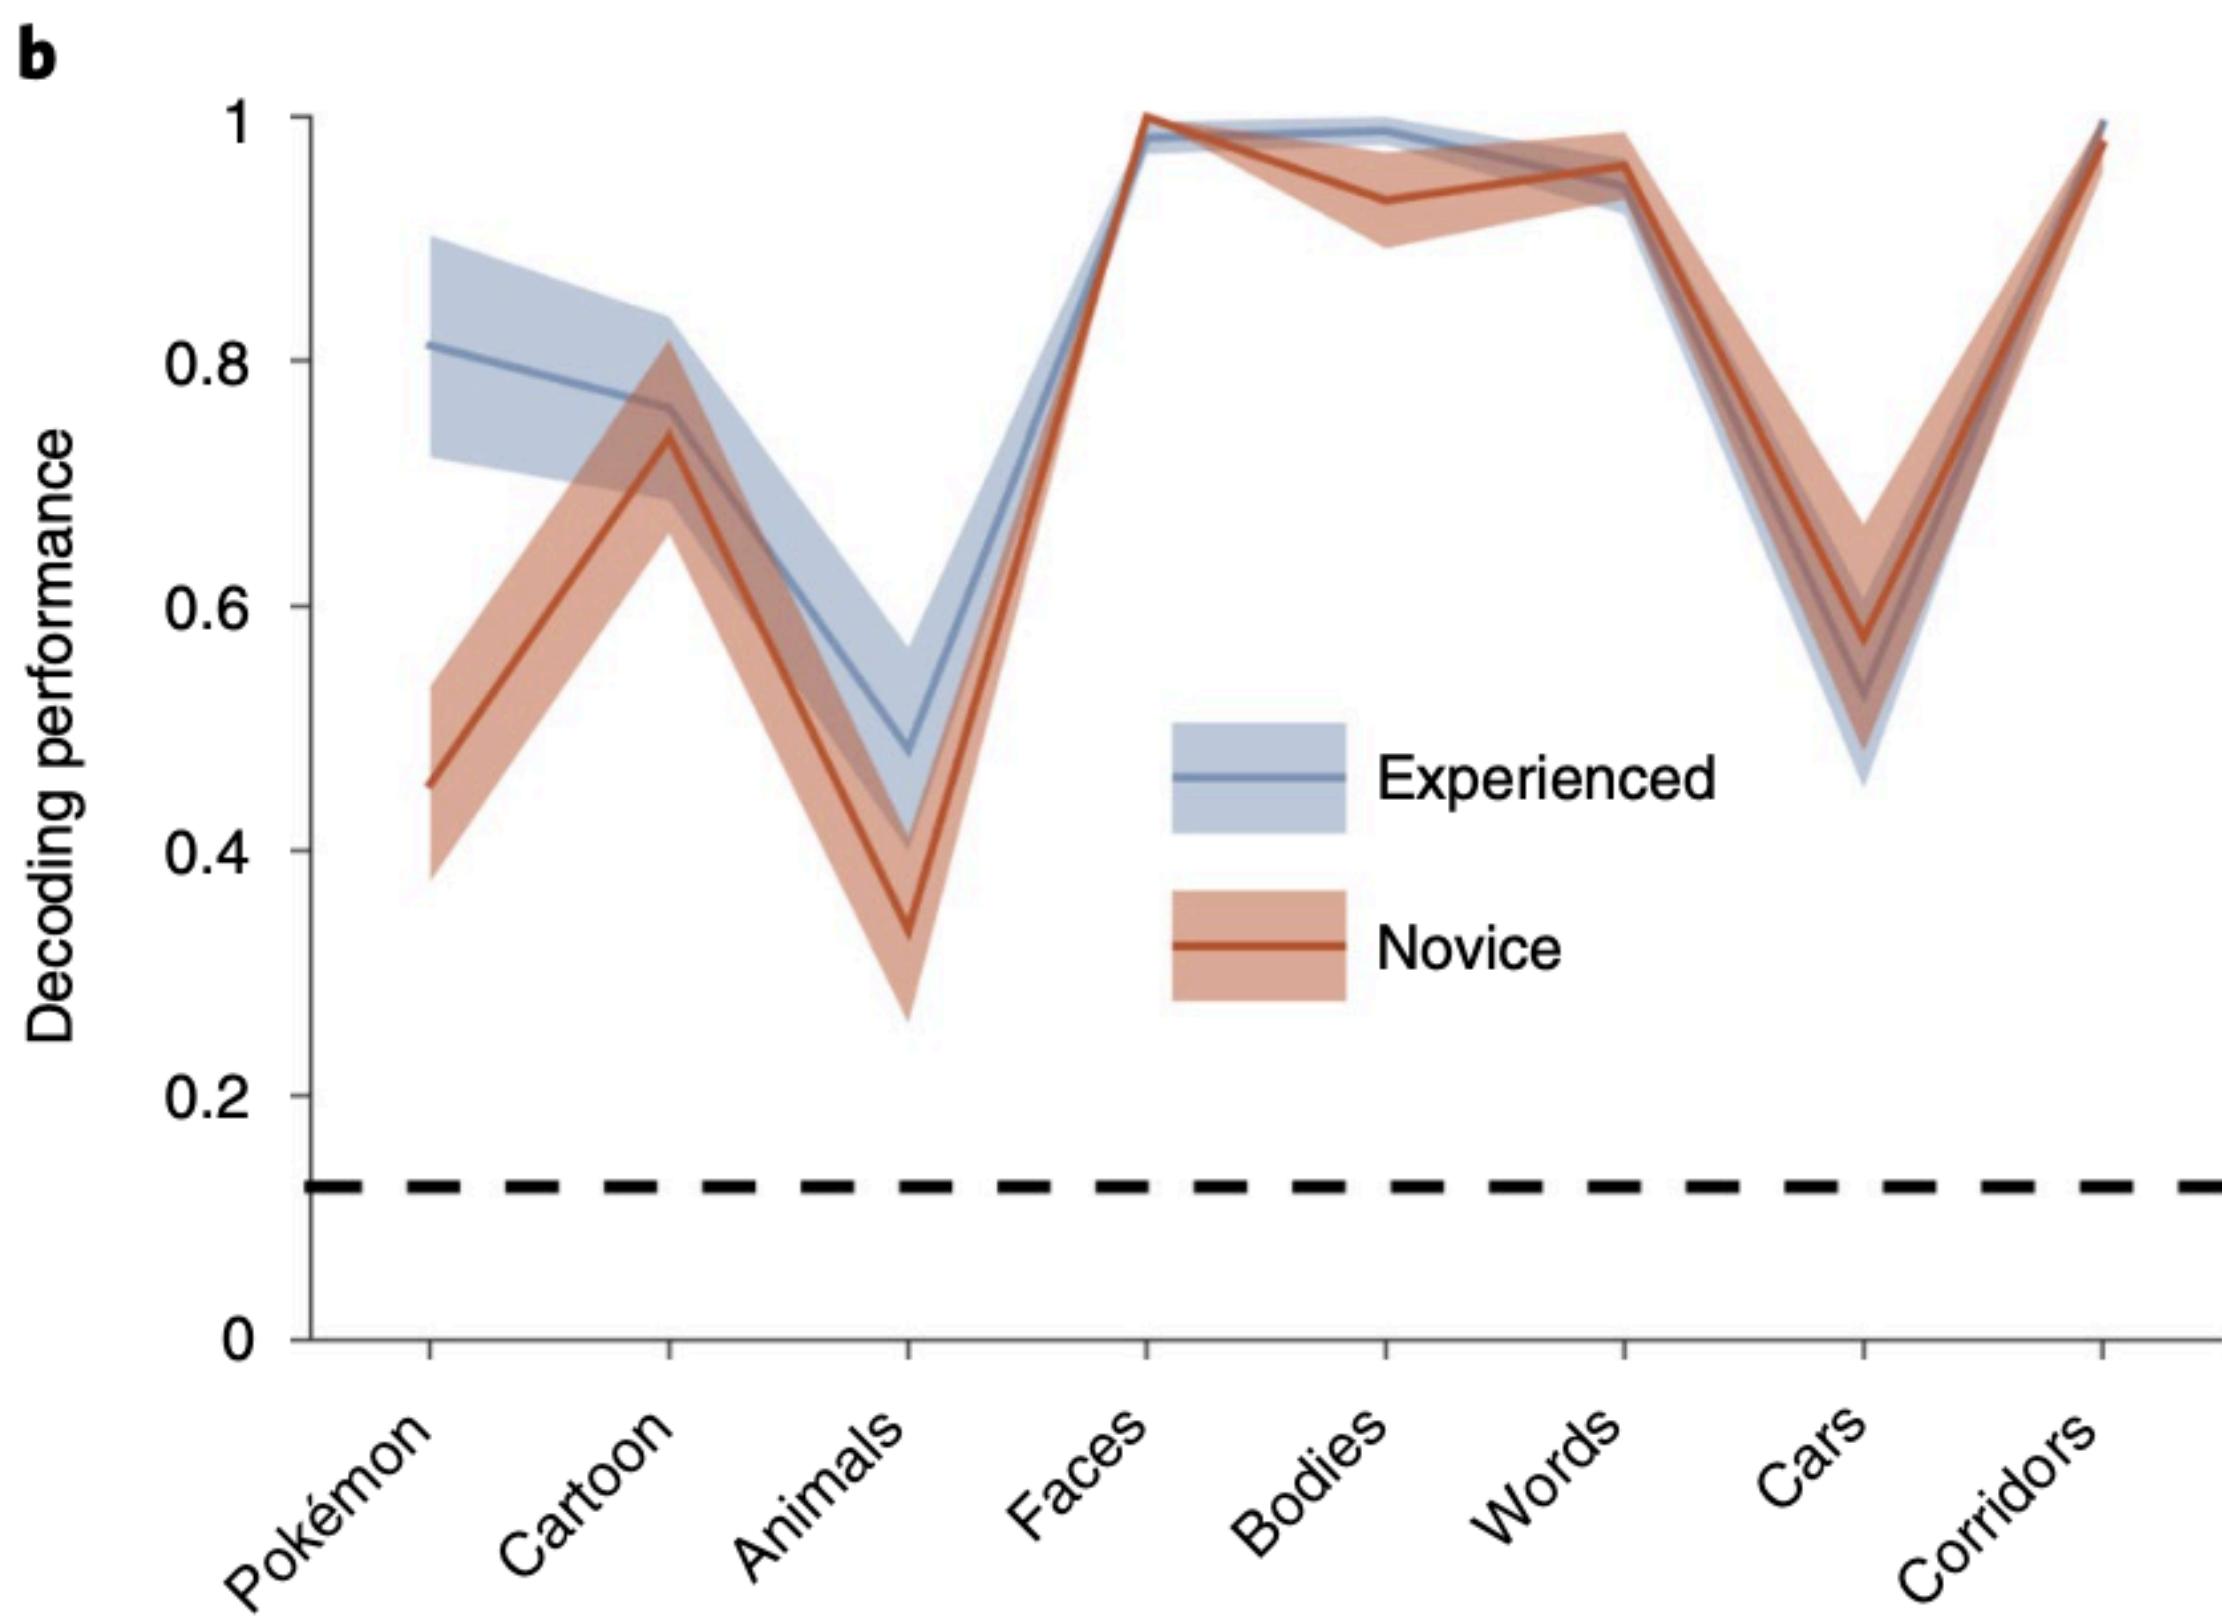

fMRI

BOLD Response Across Voxels

STIMULUS

# Figure 2 – Decoding Performance

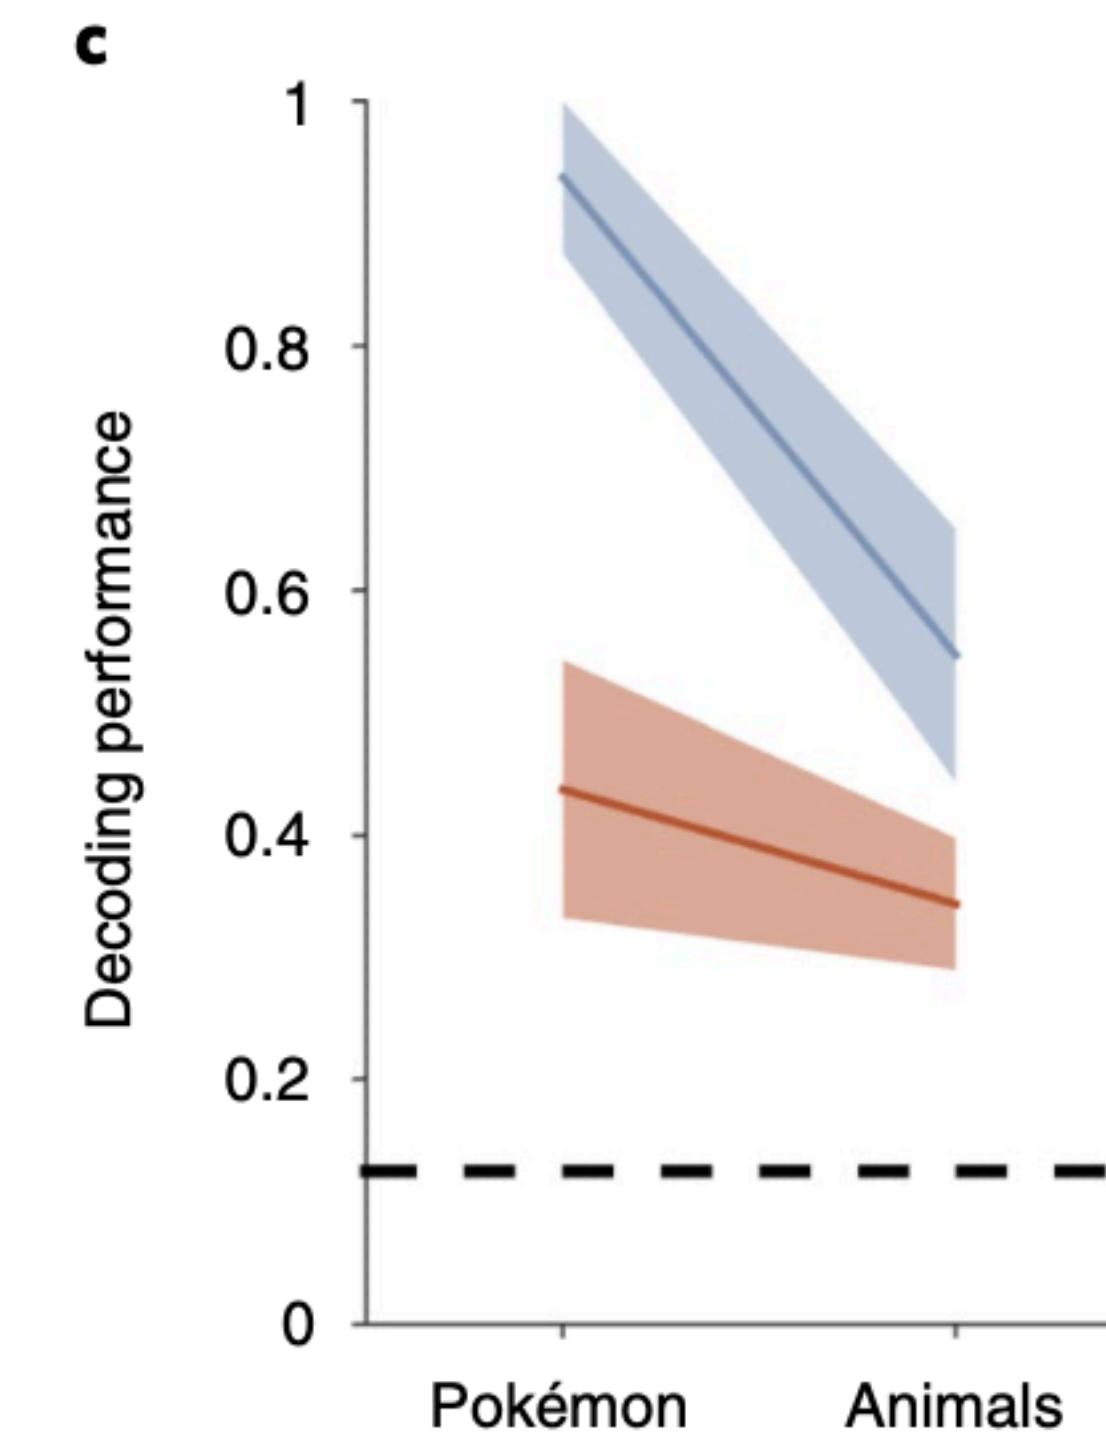

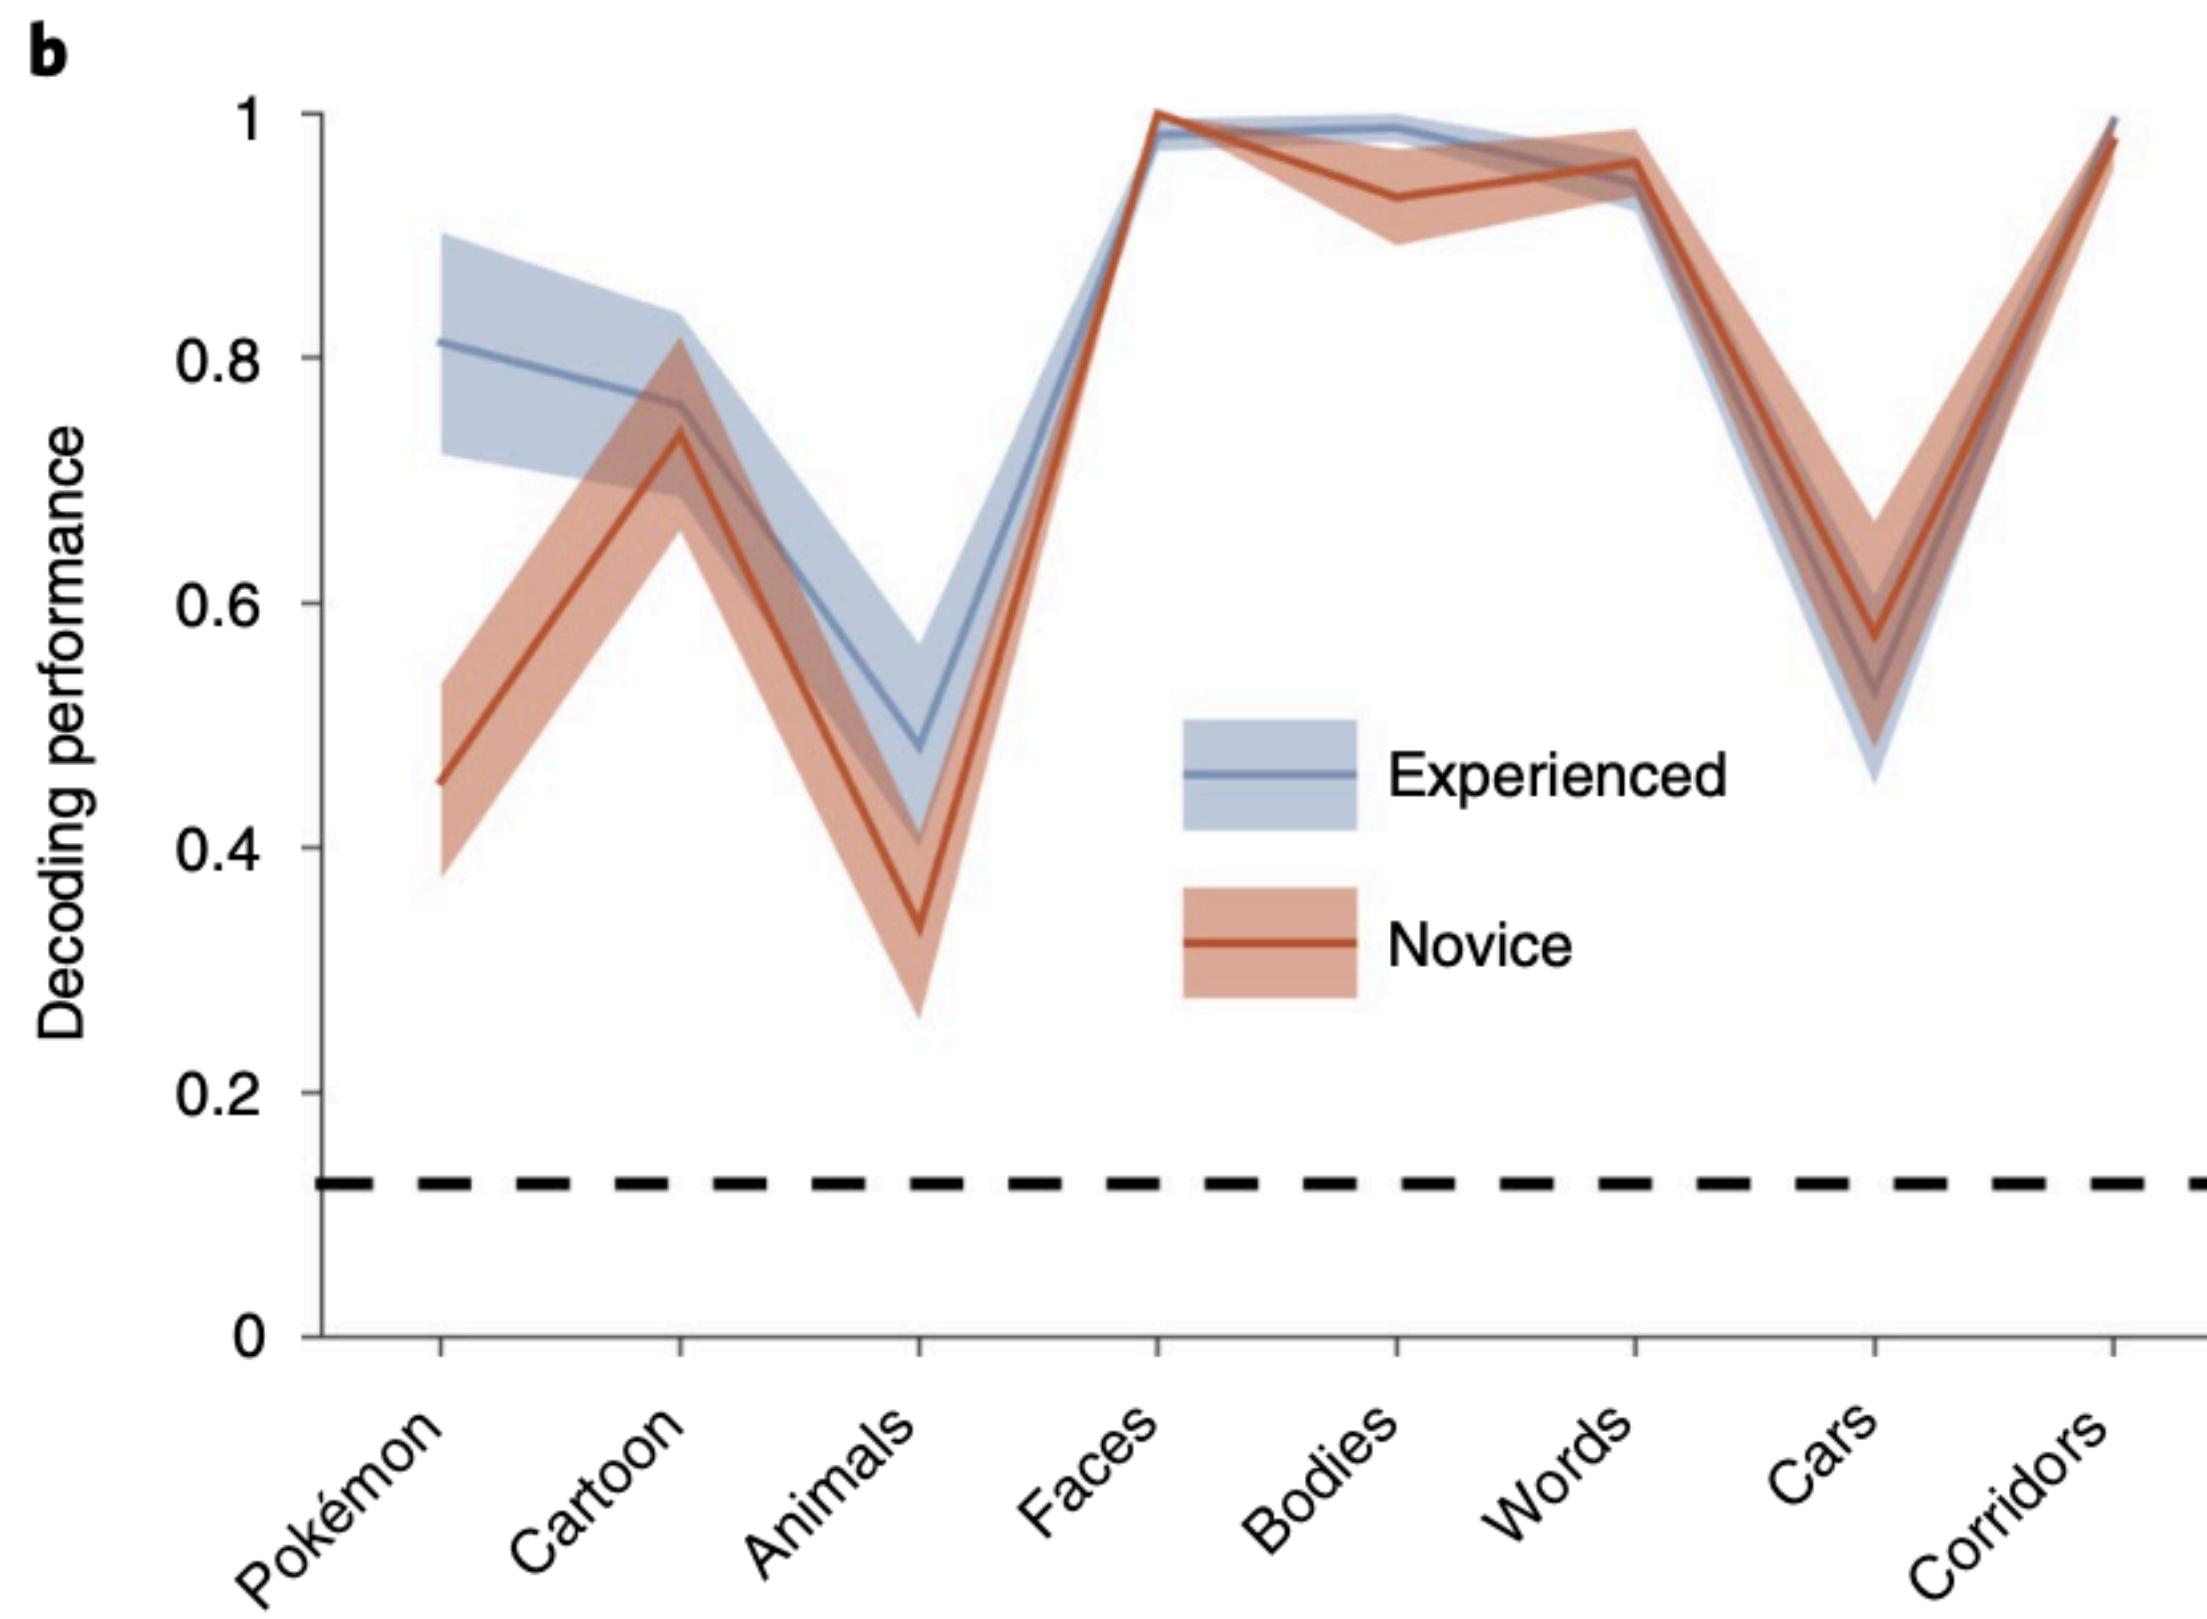

The decoder is able to accurately detect stimuli based on voxel patterns from the participants!

# Figure 2 – Decoding Performance

The decoder is able to accurately detect stimuli based on voxel patterns from the participants!

No significant differences between higher performances

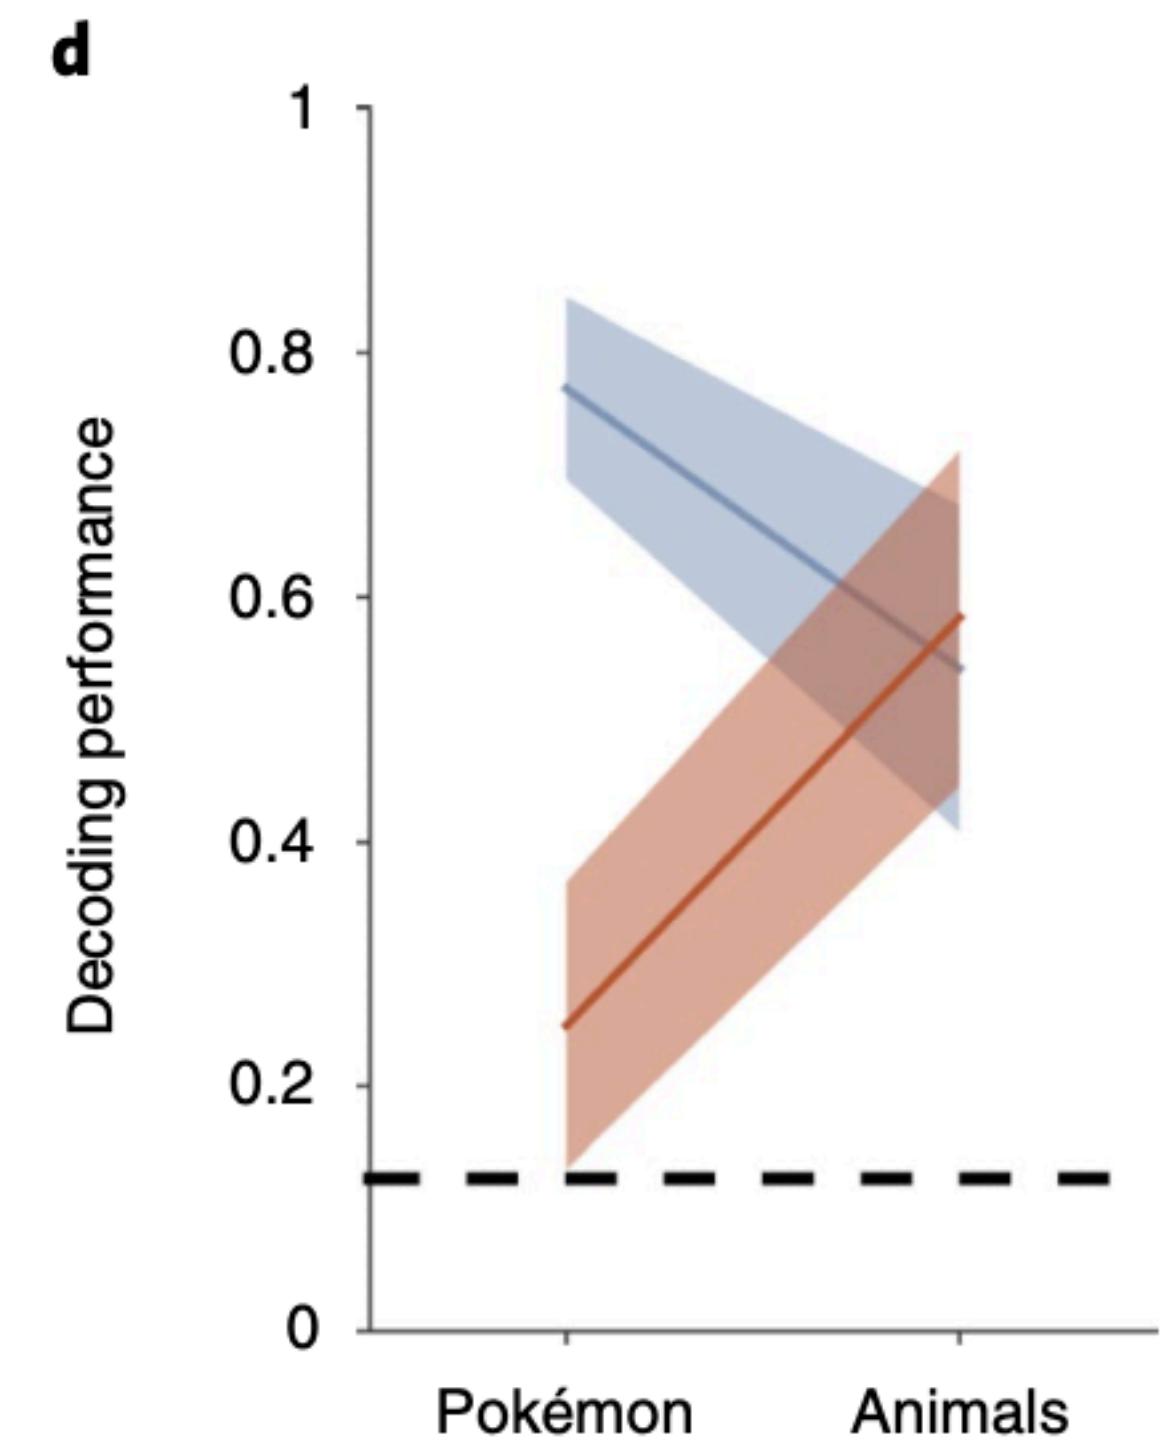

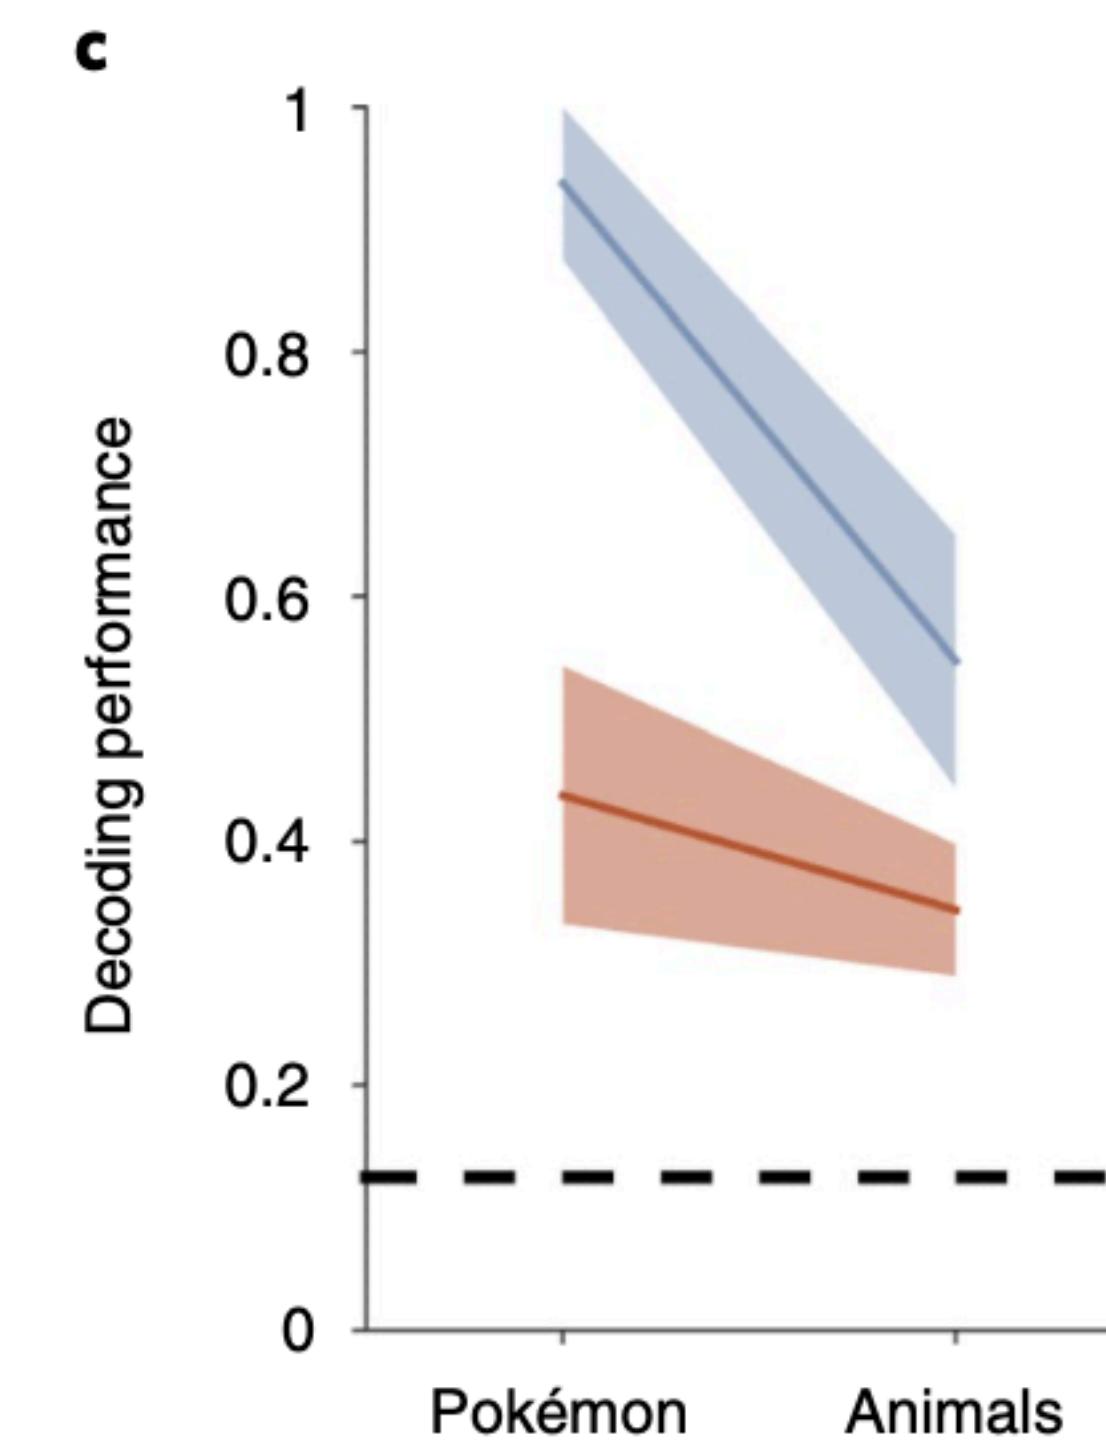

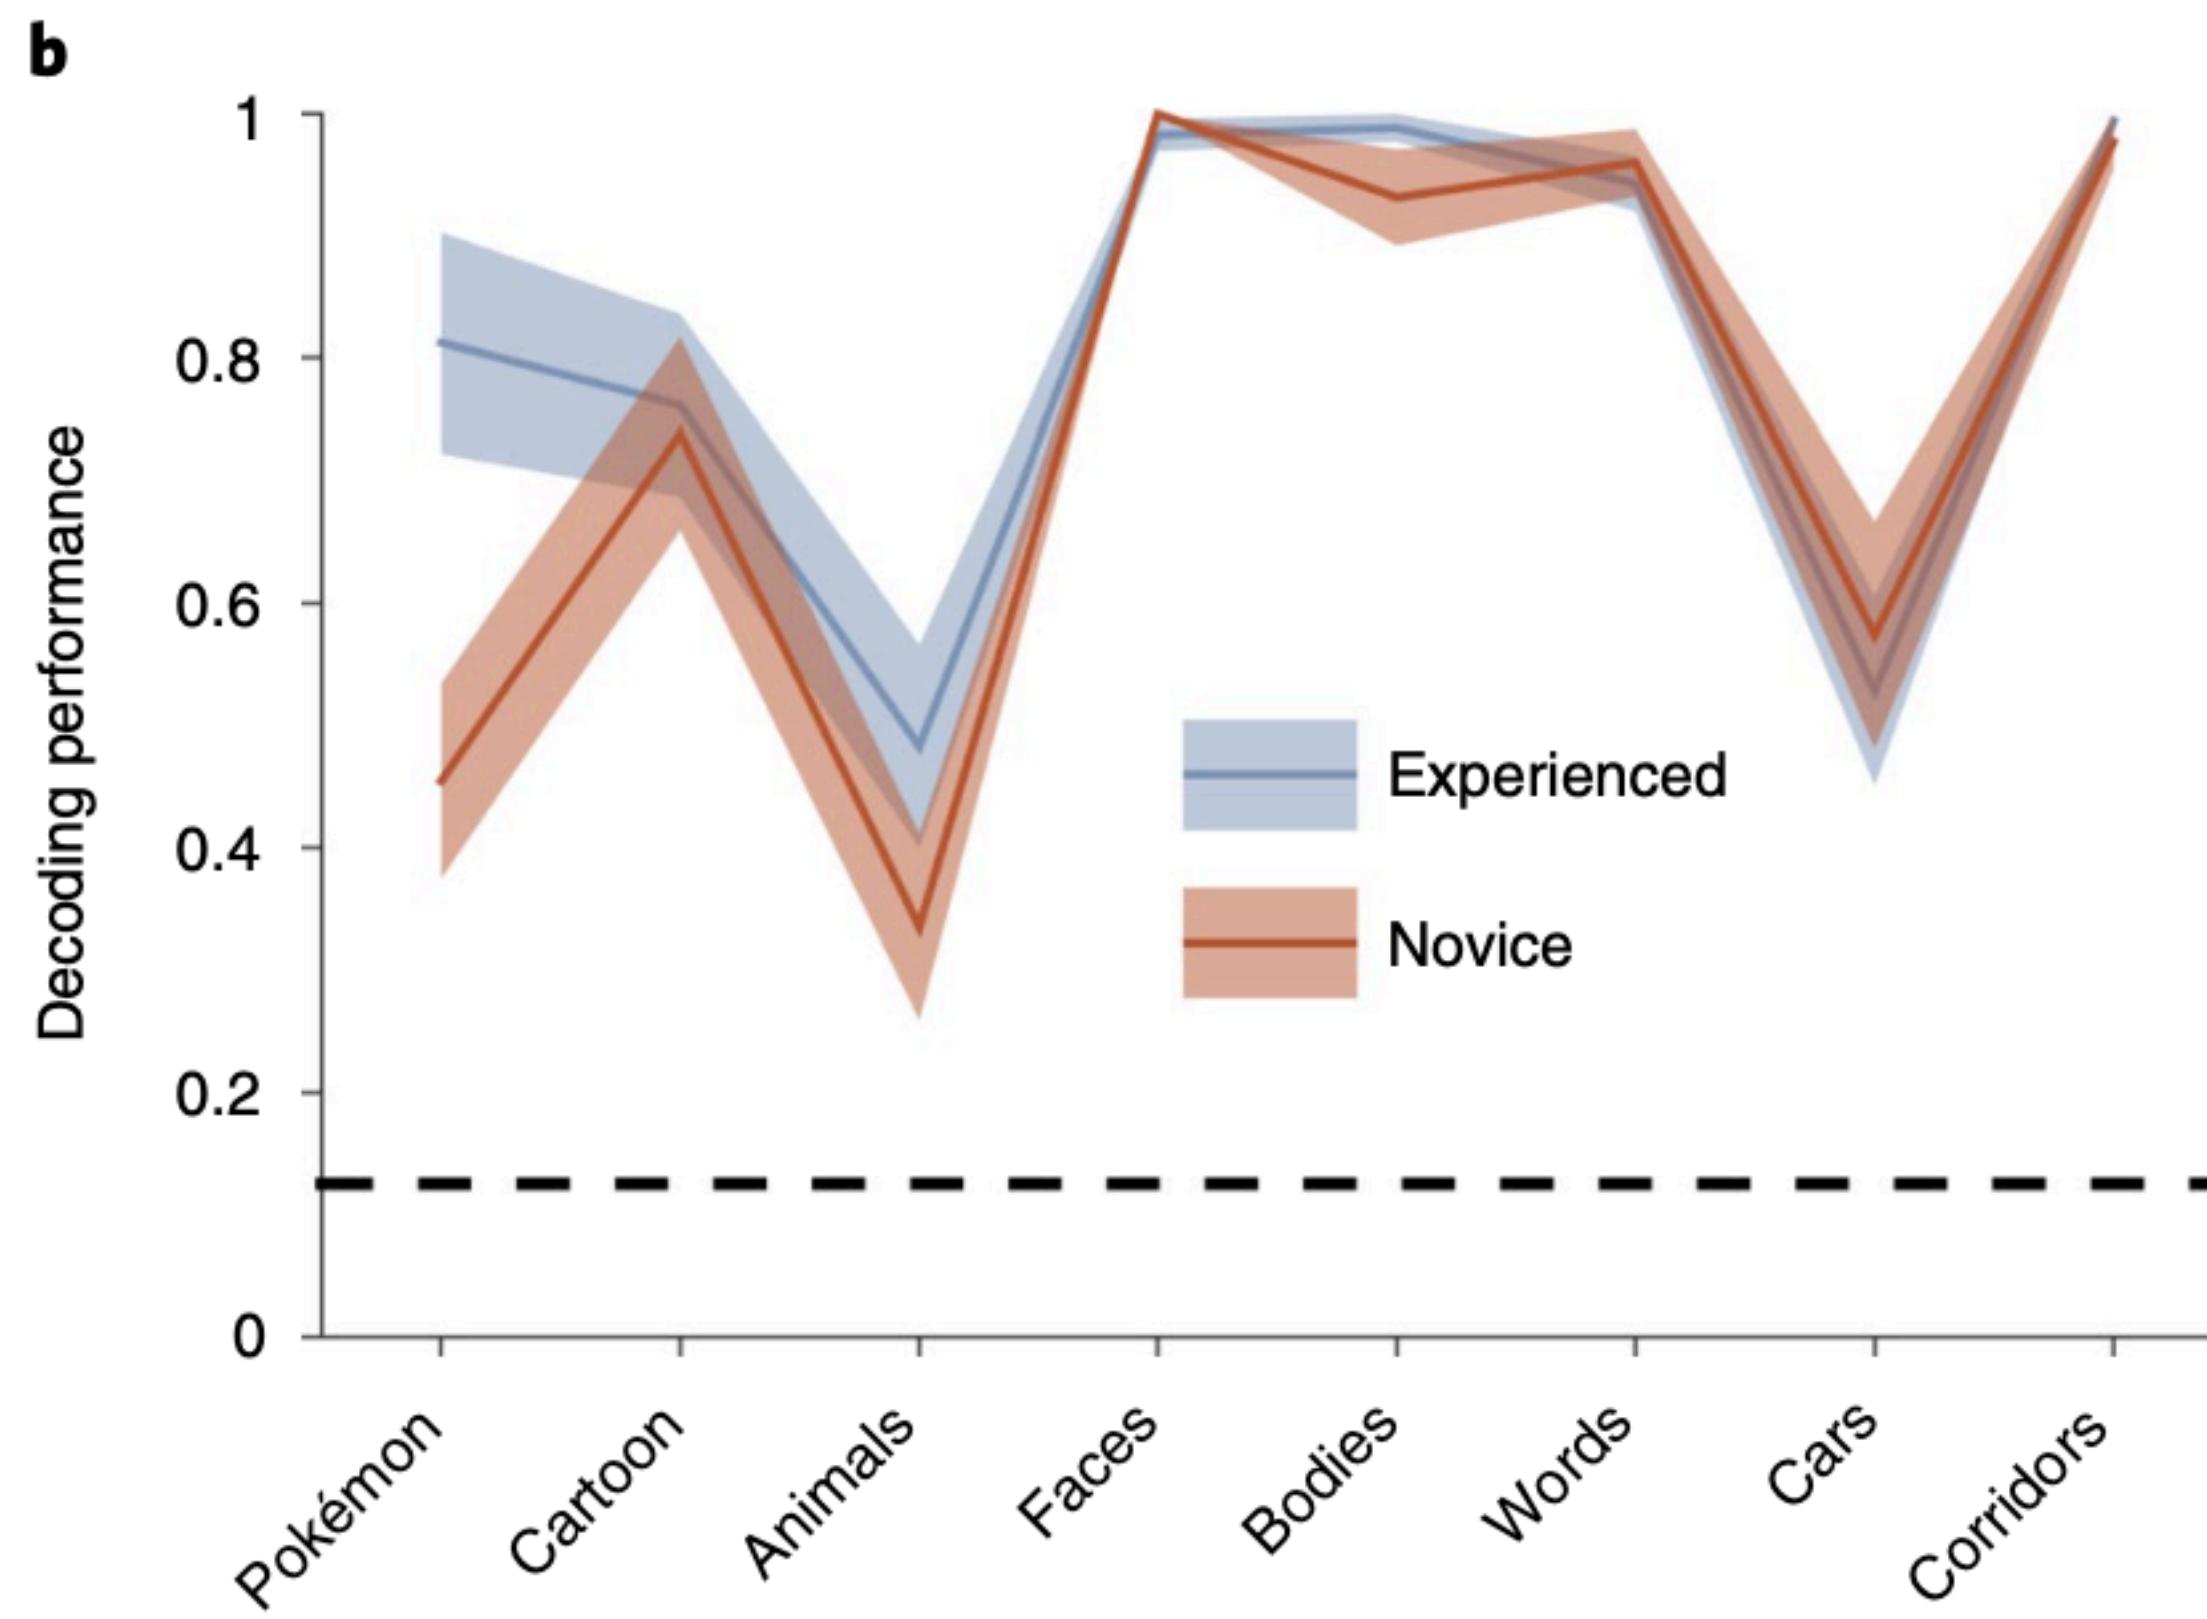

# Figure 2 – Decoding Performance

The decoder is able to accurately detect stimuli based on voxel patterns from the participants!

No significant differences between higher performances

So what's going on here?

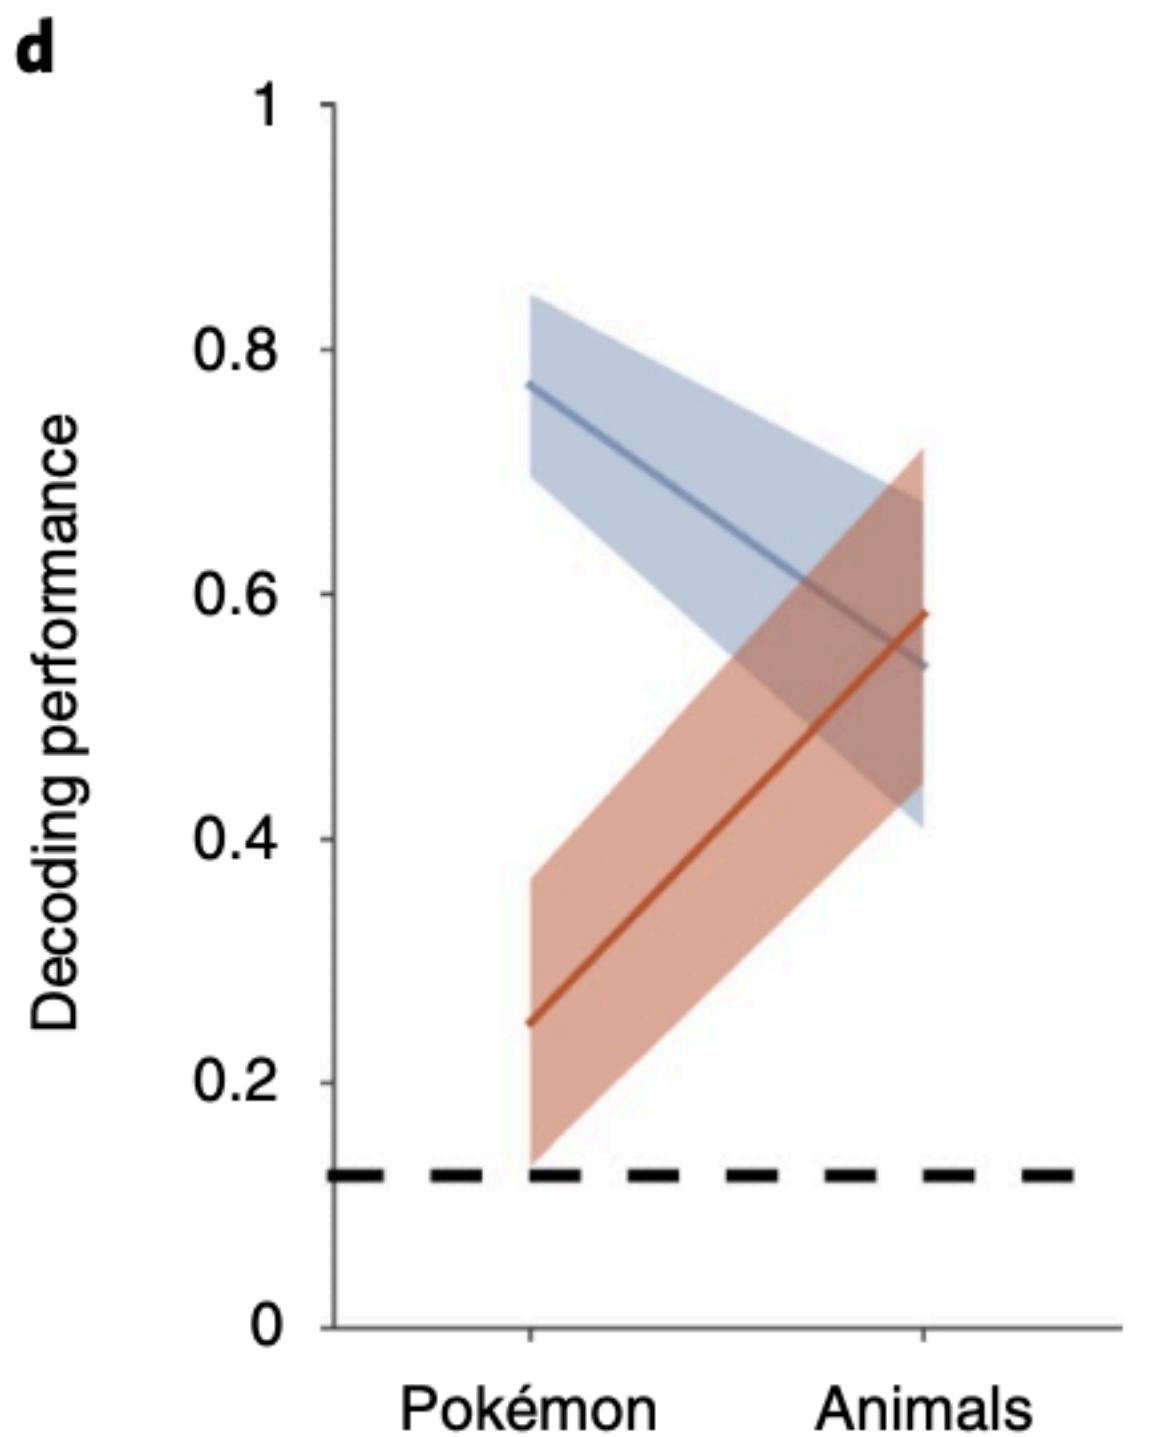

# Is attention driving results?

Is it possible that the boost in the pattern of results found merely be a result of attention?

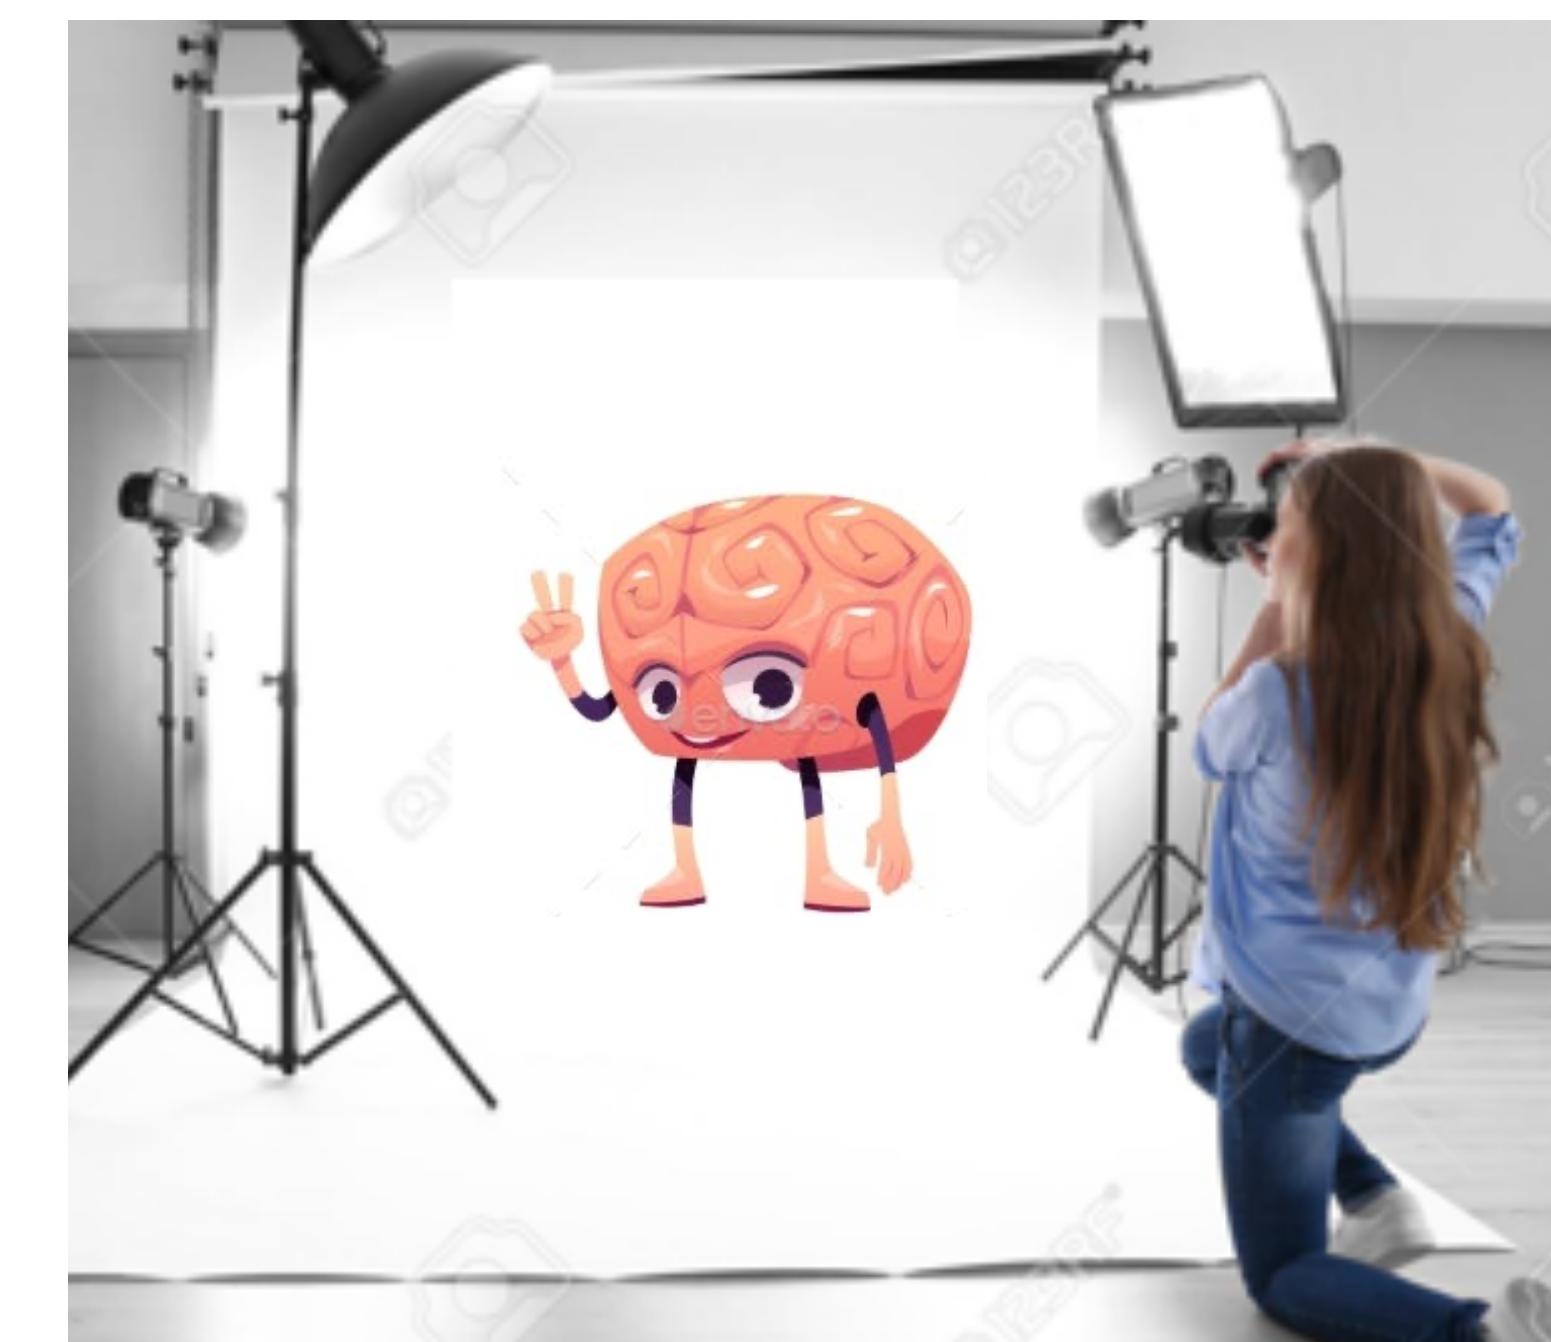

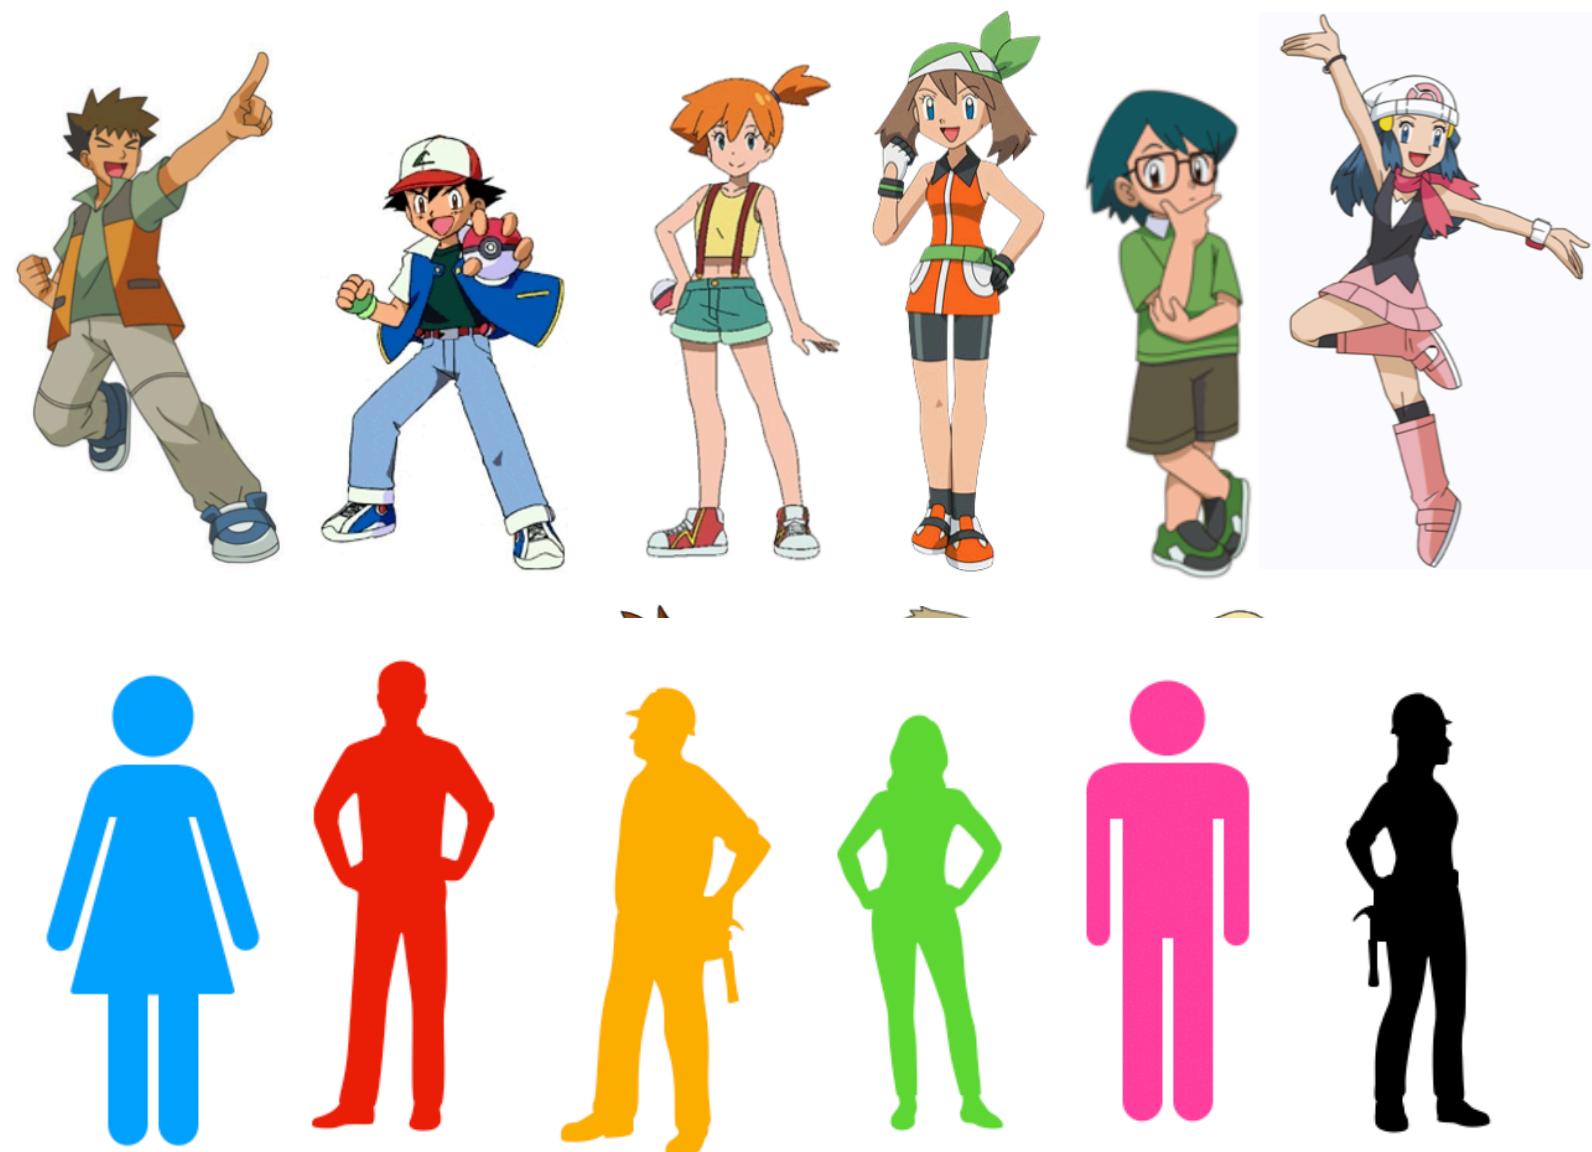

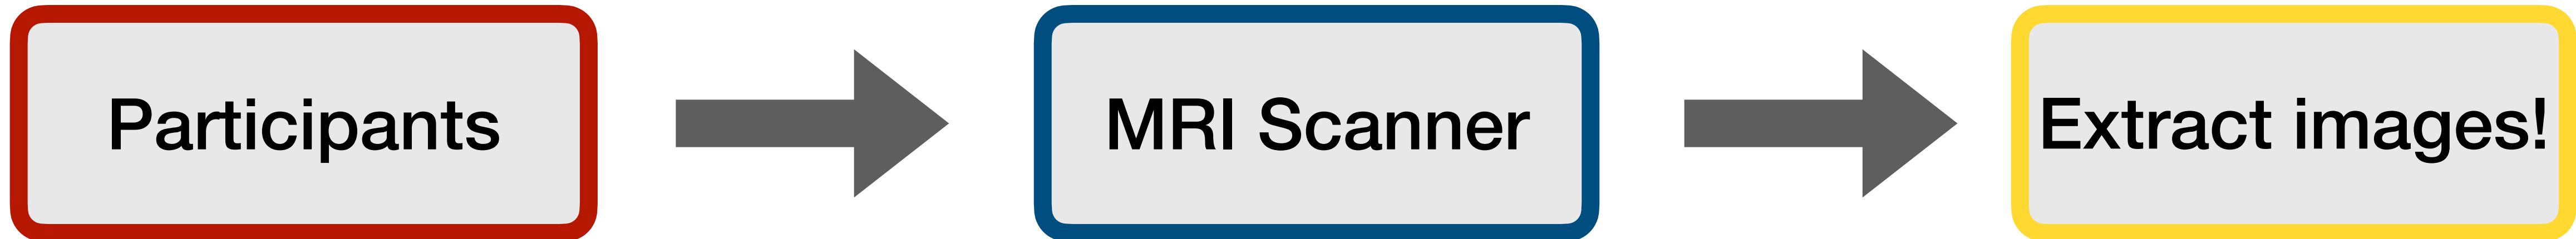

So what's going on here?

Argued that attention can boost signals to the category of expertise (Harel et al., 2010)

Replicate study – but with a more demanding attention task as well.

# Experimental Design #2

# Experimental Design #2

In this task, participants need to determine whether the same image was sandwiched between another image

# Is attention driving results? — NO!

Is it possible that the boost in the pattern of results found merely be a result of attention?

Attention is not driving results

Argued that attention can boost signals to the category of expertise (Harel et al., 2010)

Replicate study — but with a more demanding attention task as well.

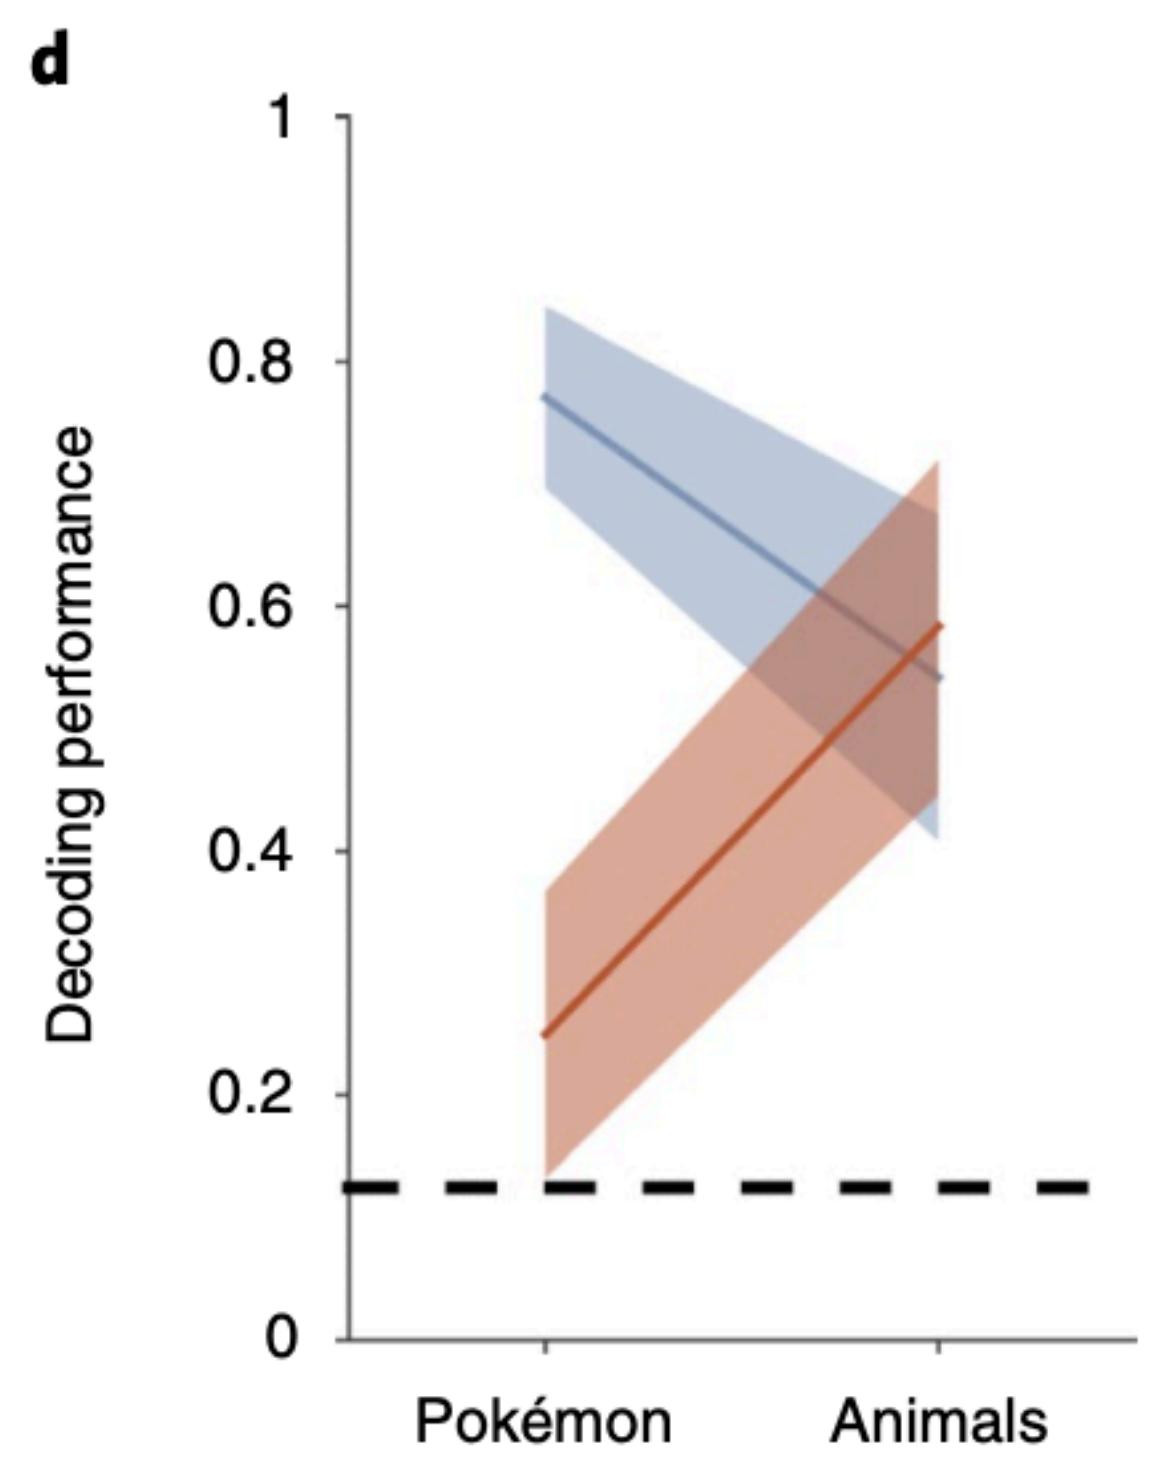

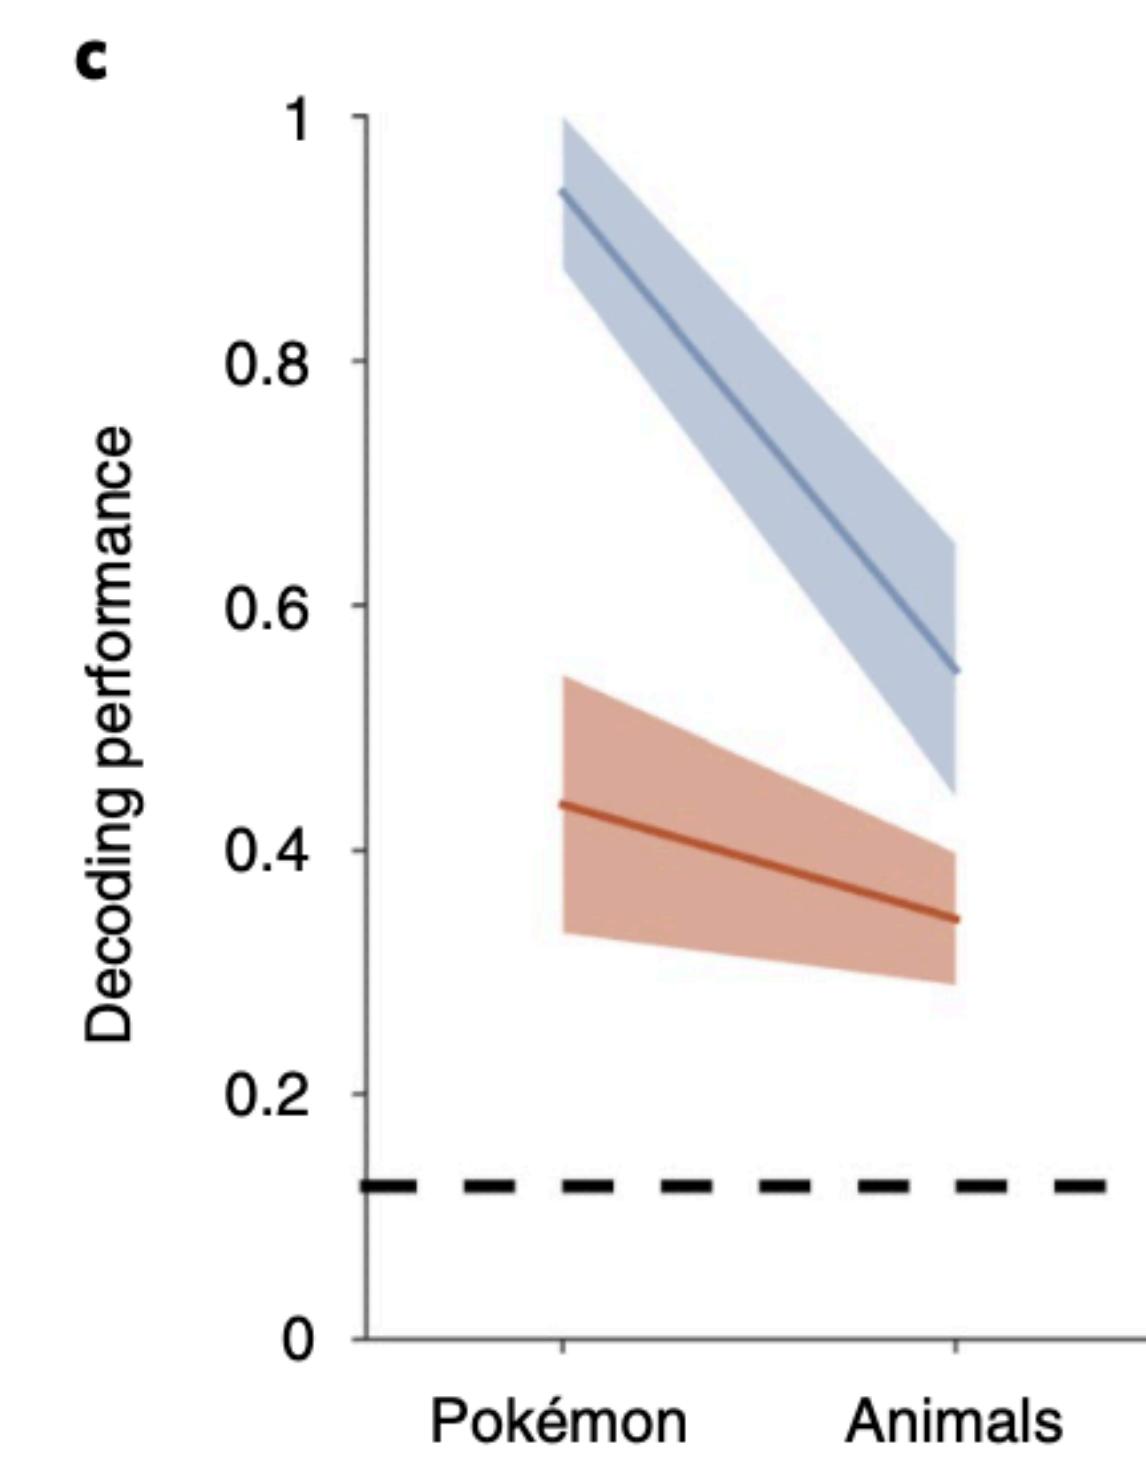

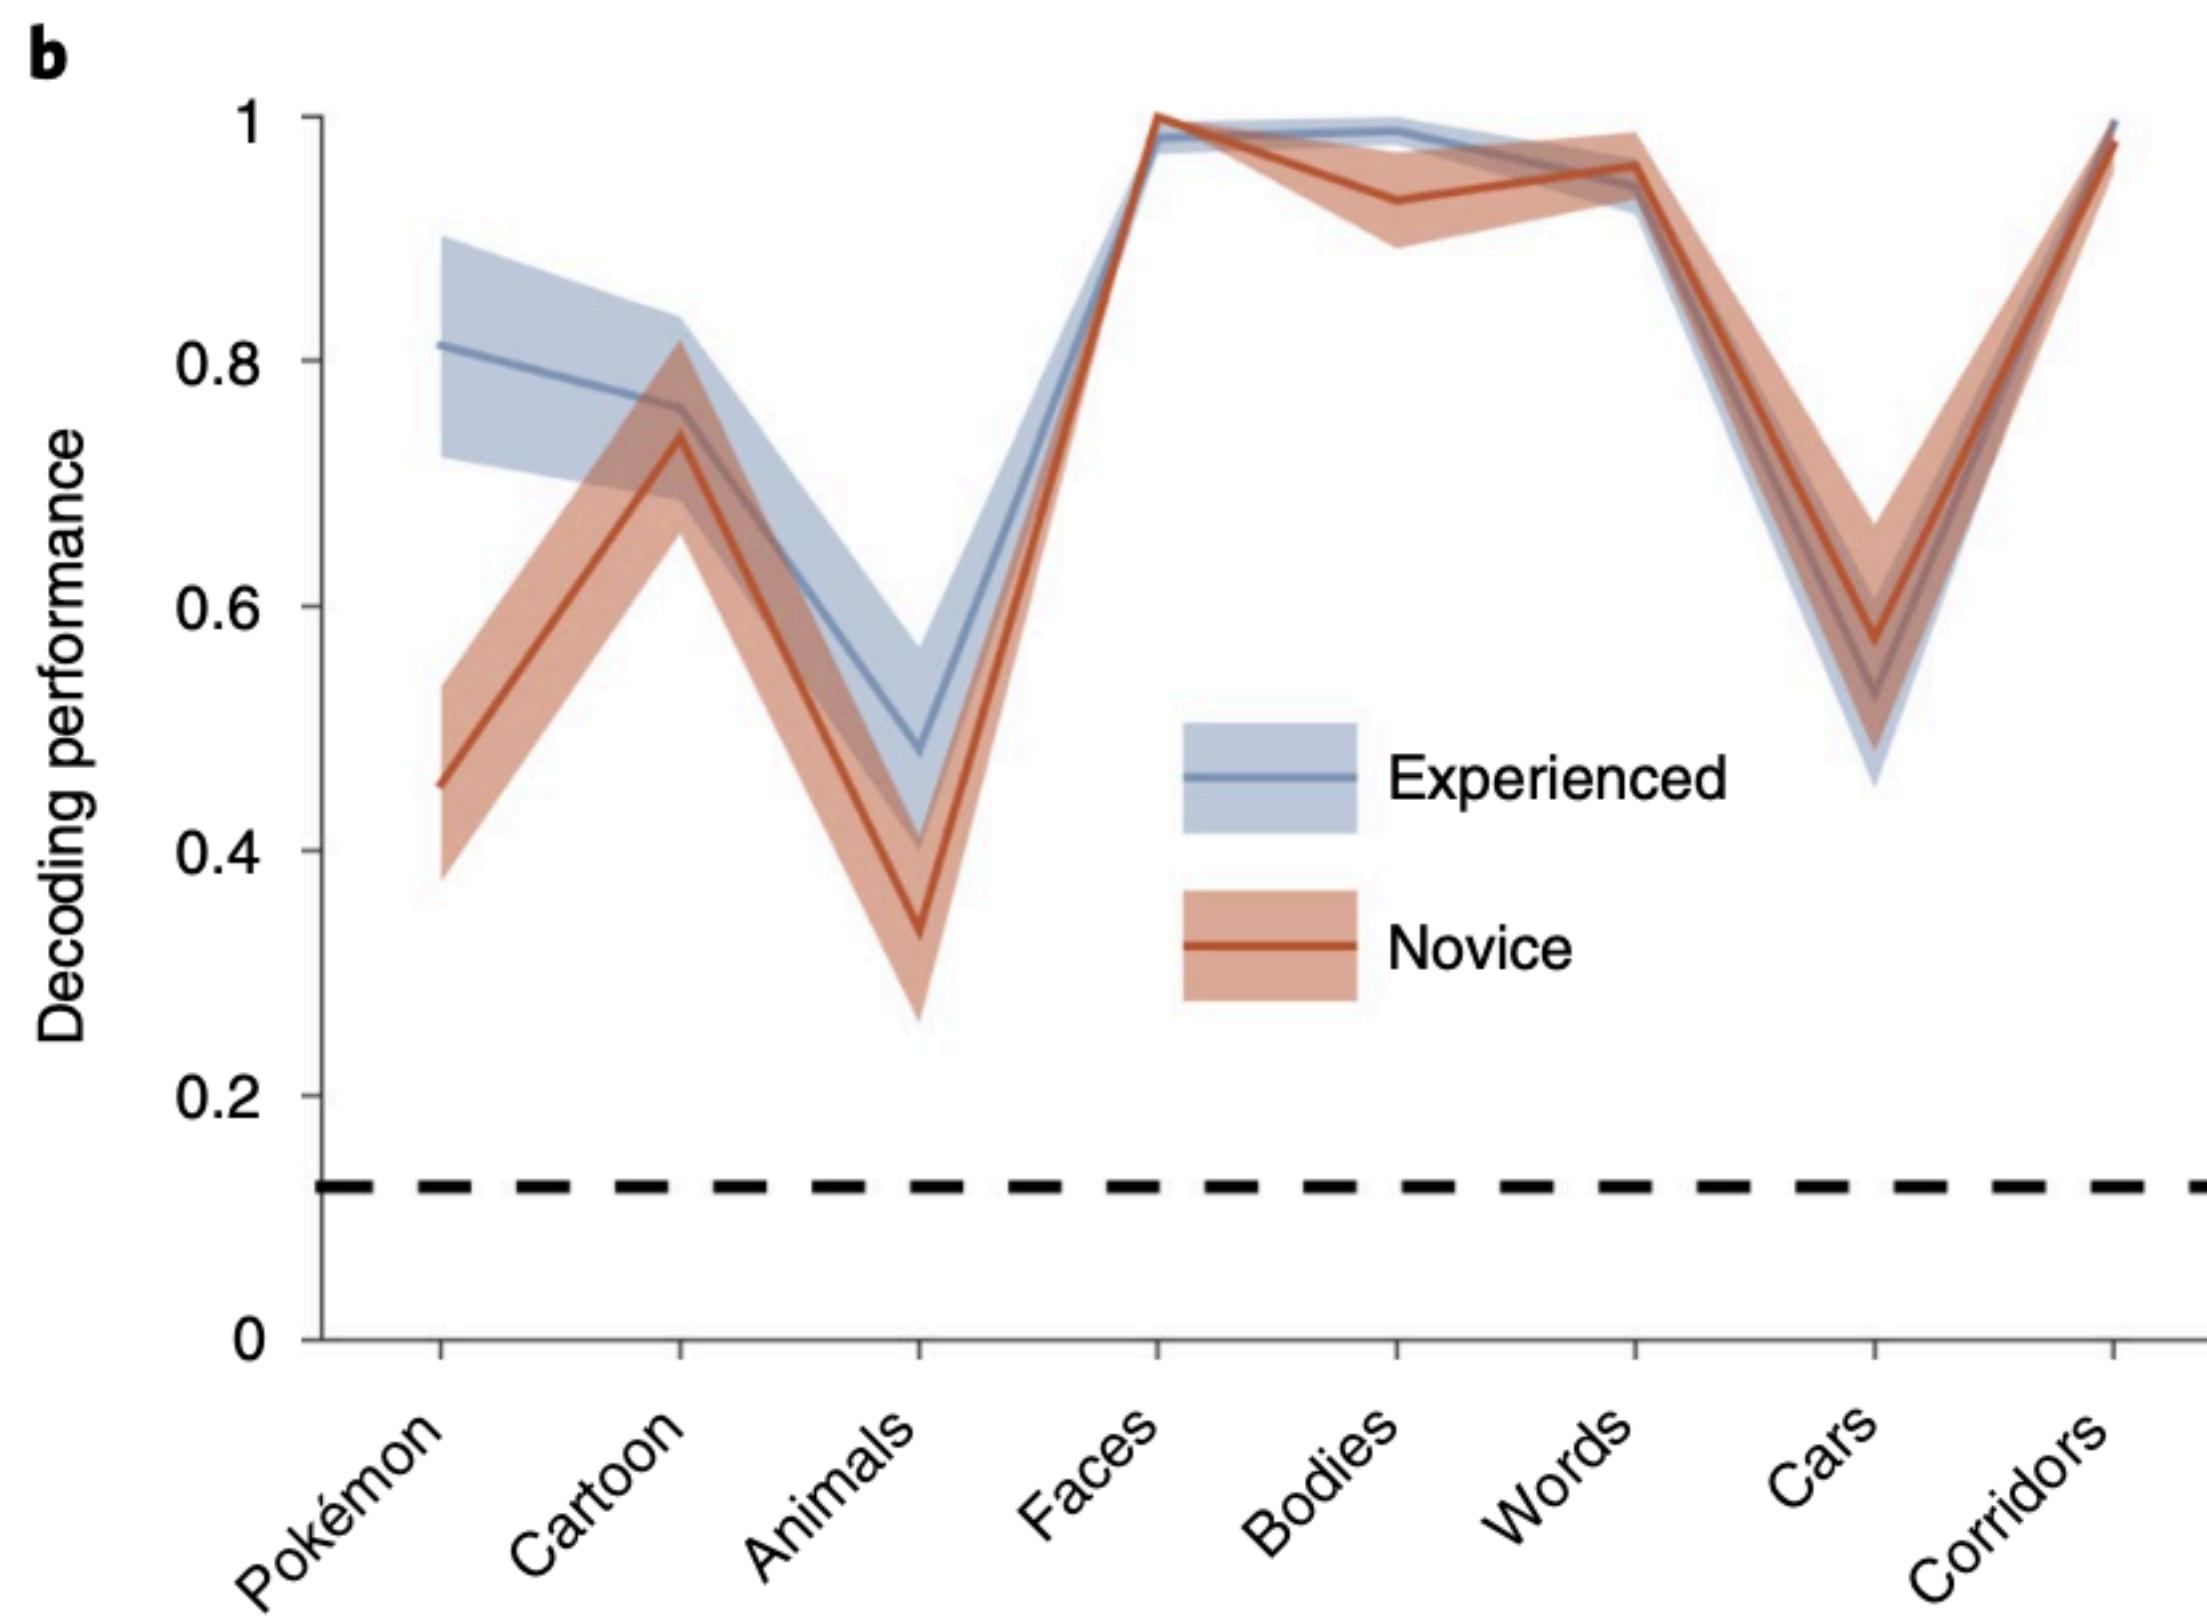

# Figure 2 – Decoding Performance

The decoder is able to accurately detect stimuli based on voxel patterns from the participants!

No significant differences between higher performances

Attention is not driving results

# *DISCUSSION QUESTION(S)!*

*Do you think there are other stimuli that could find similar results and add contextual information – like Yu-Gi-Oh!, for example? How would this help the purpose of this study? Would these have their own region or share space with Pokemon?*

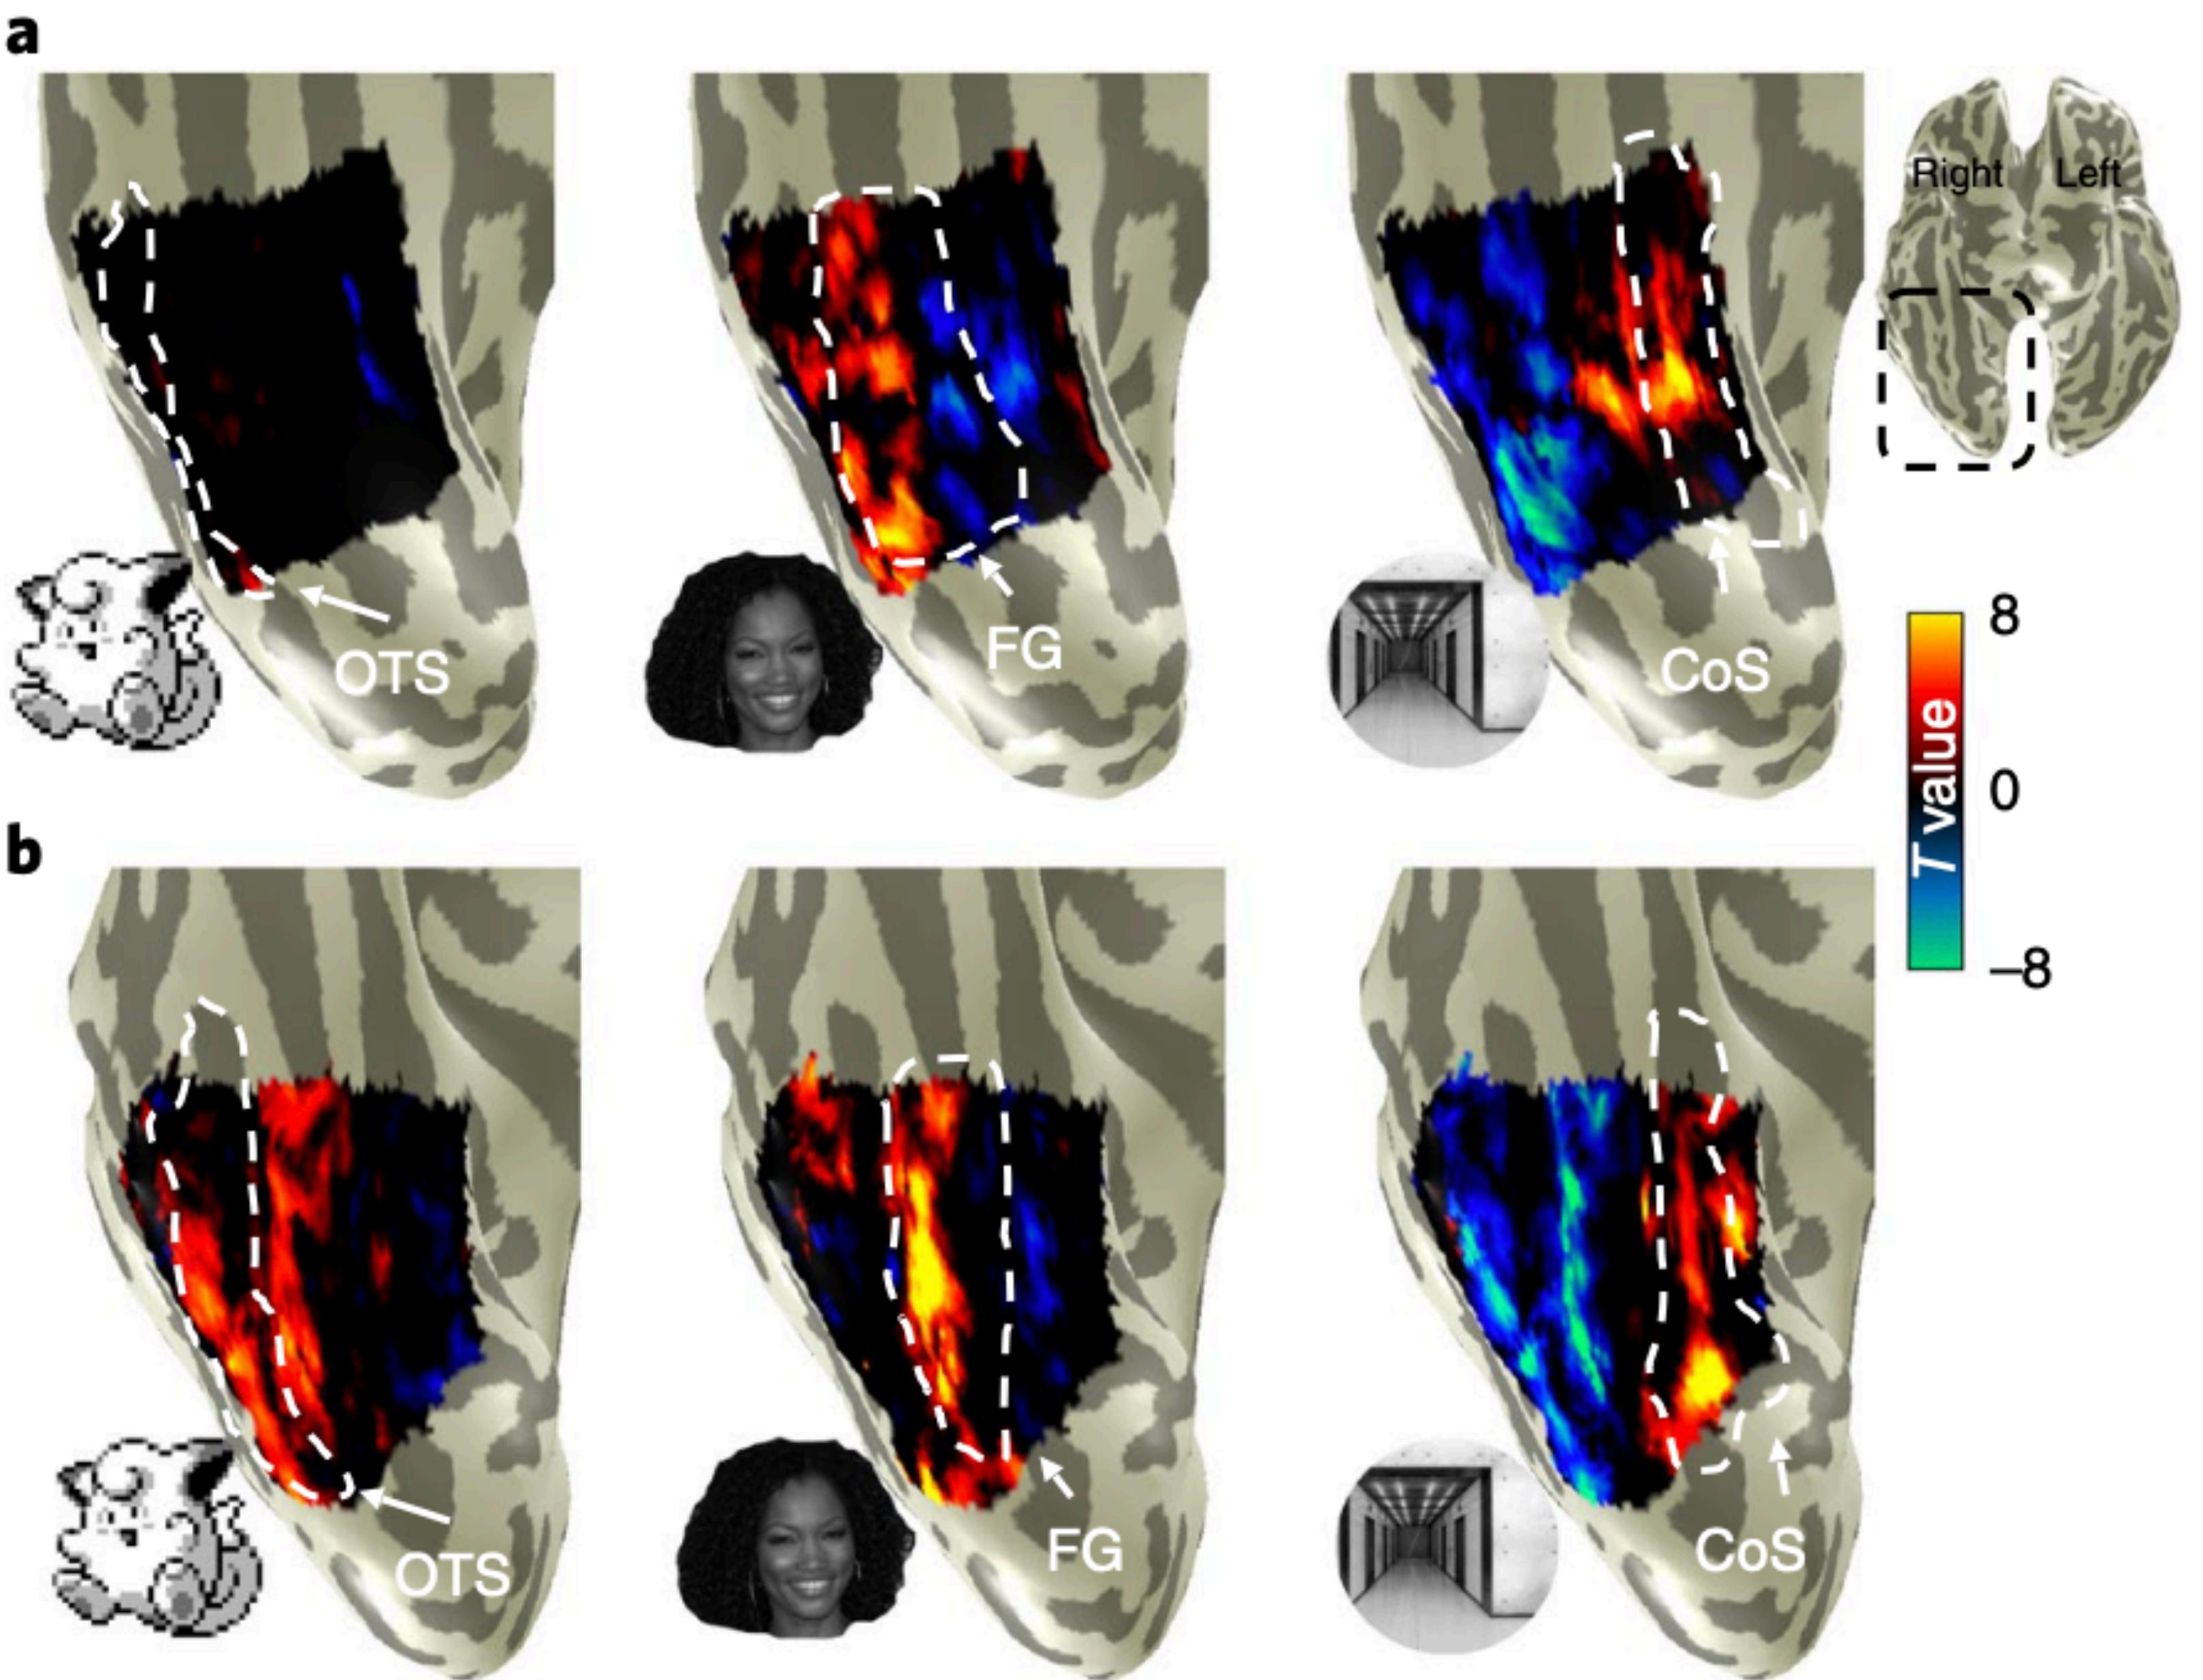

**Does Pokemon generate distributed response patterns with similar topographies across experienced participants?**

## Pokemon Novices

## Pokemon Novices

L ← → M

L ← → M

L ← → M

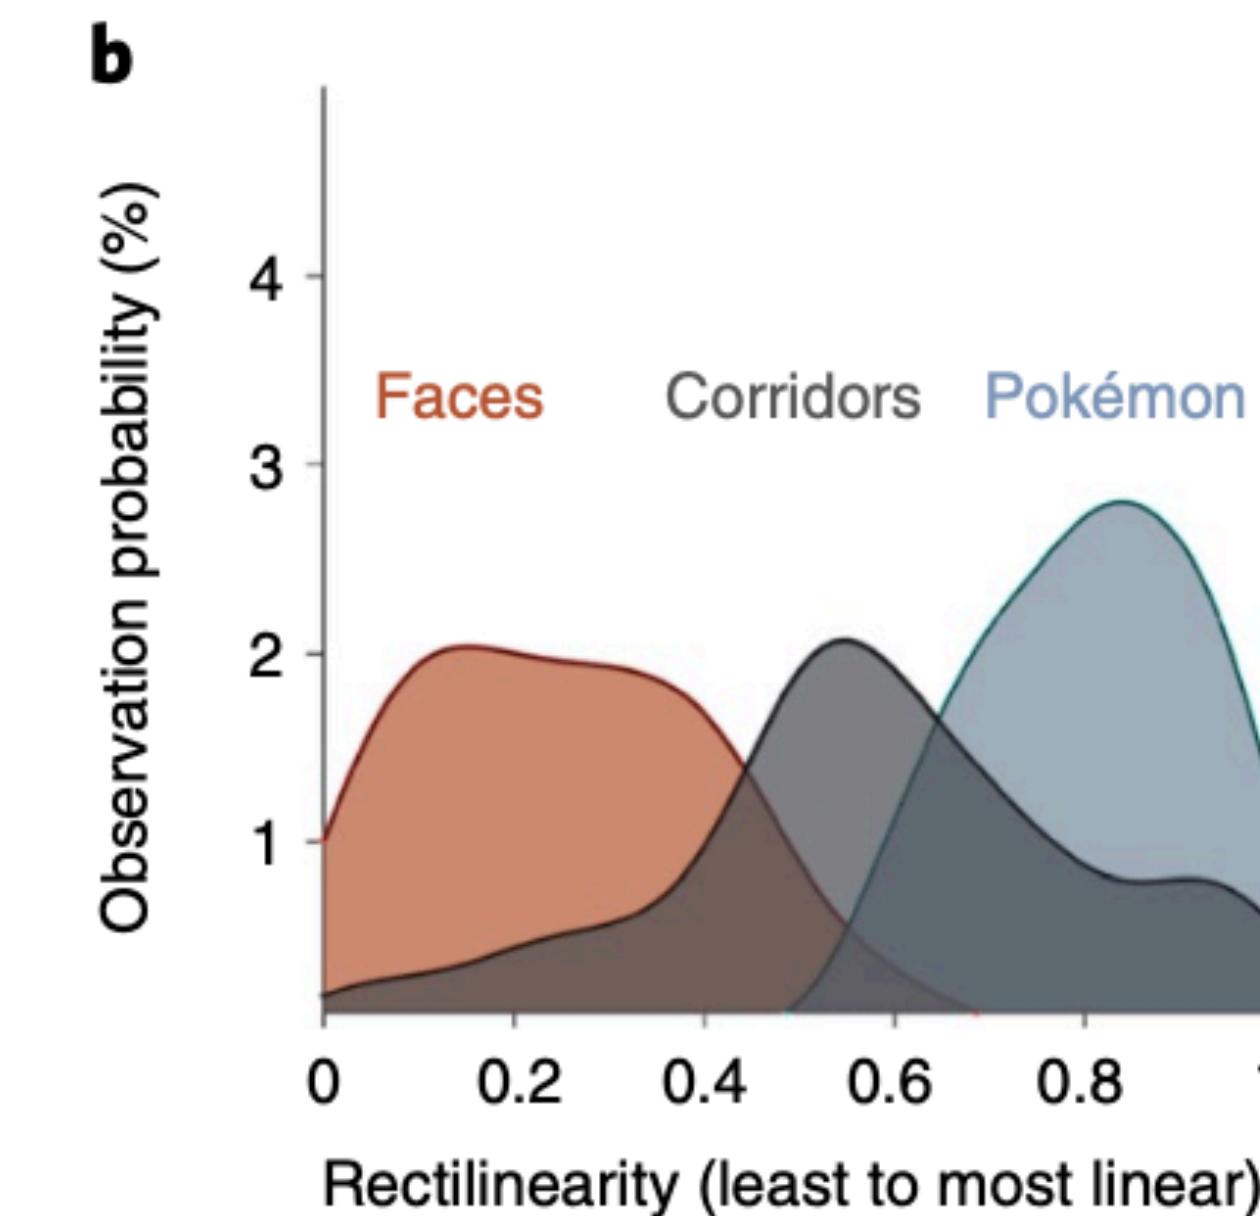

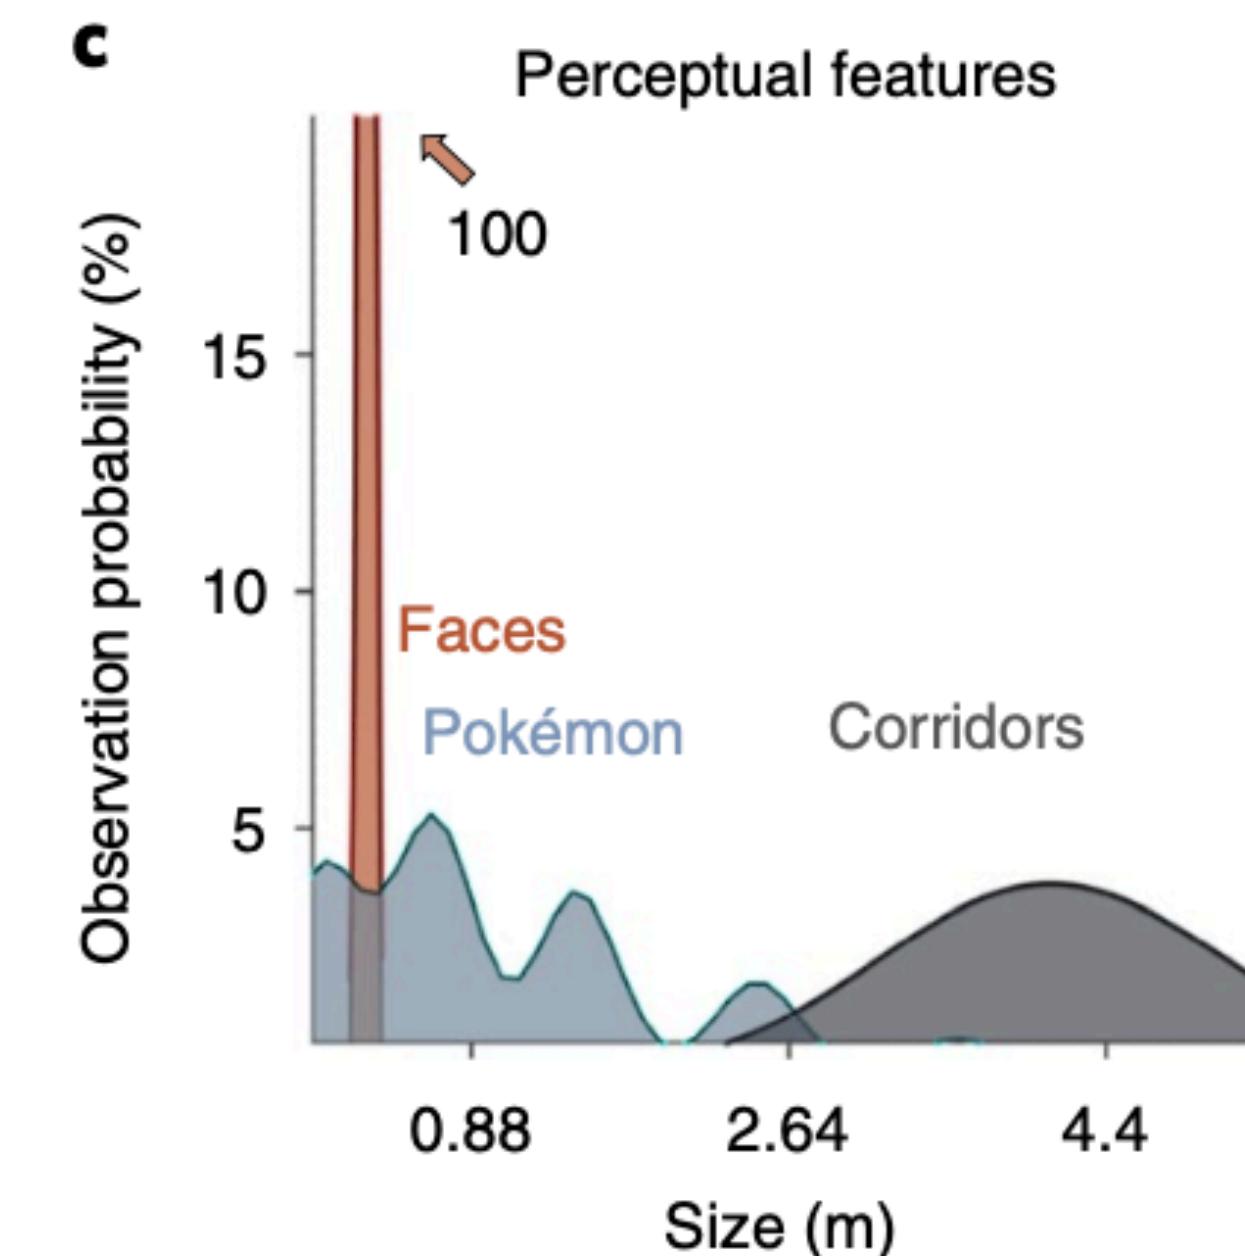

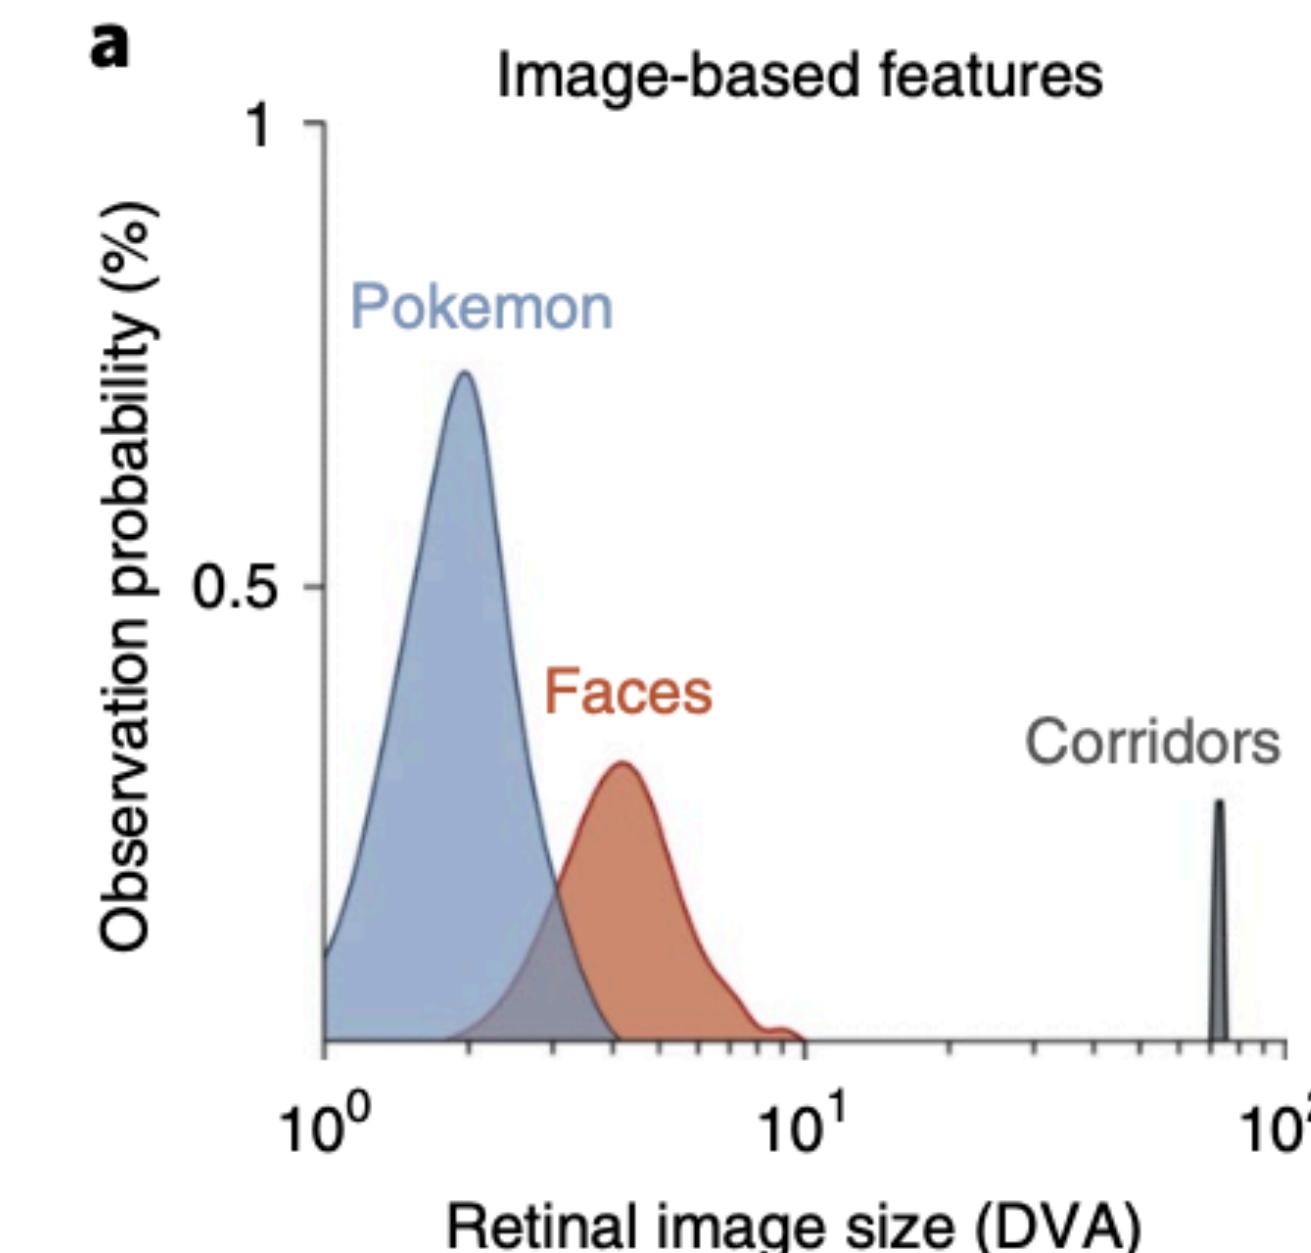

L ← → M

Eccentricity appears to be  
driving the topographical  
organization of the VTA!

# Questions they aim to address:

1

Does extensive experience with Pokemon from early childhood to adulthood result in novel representation in the visual cortex?

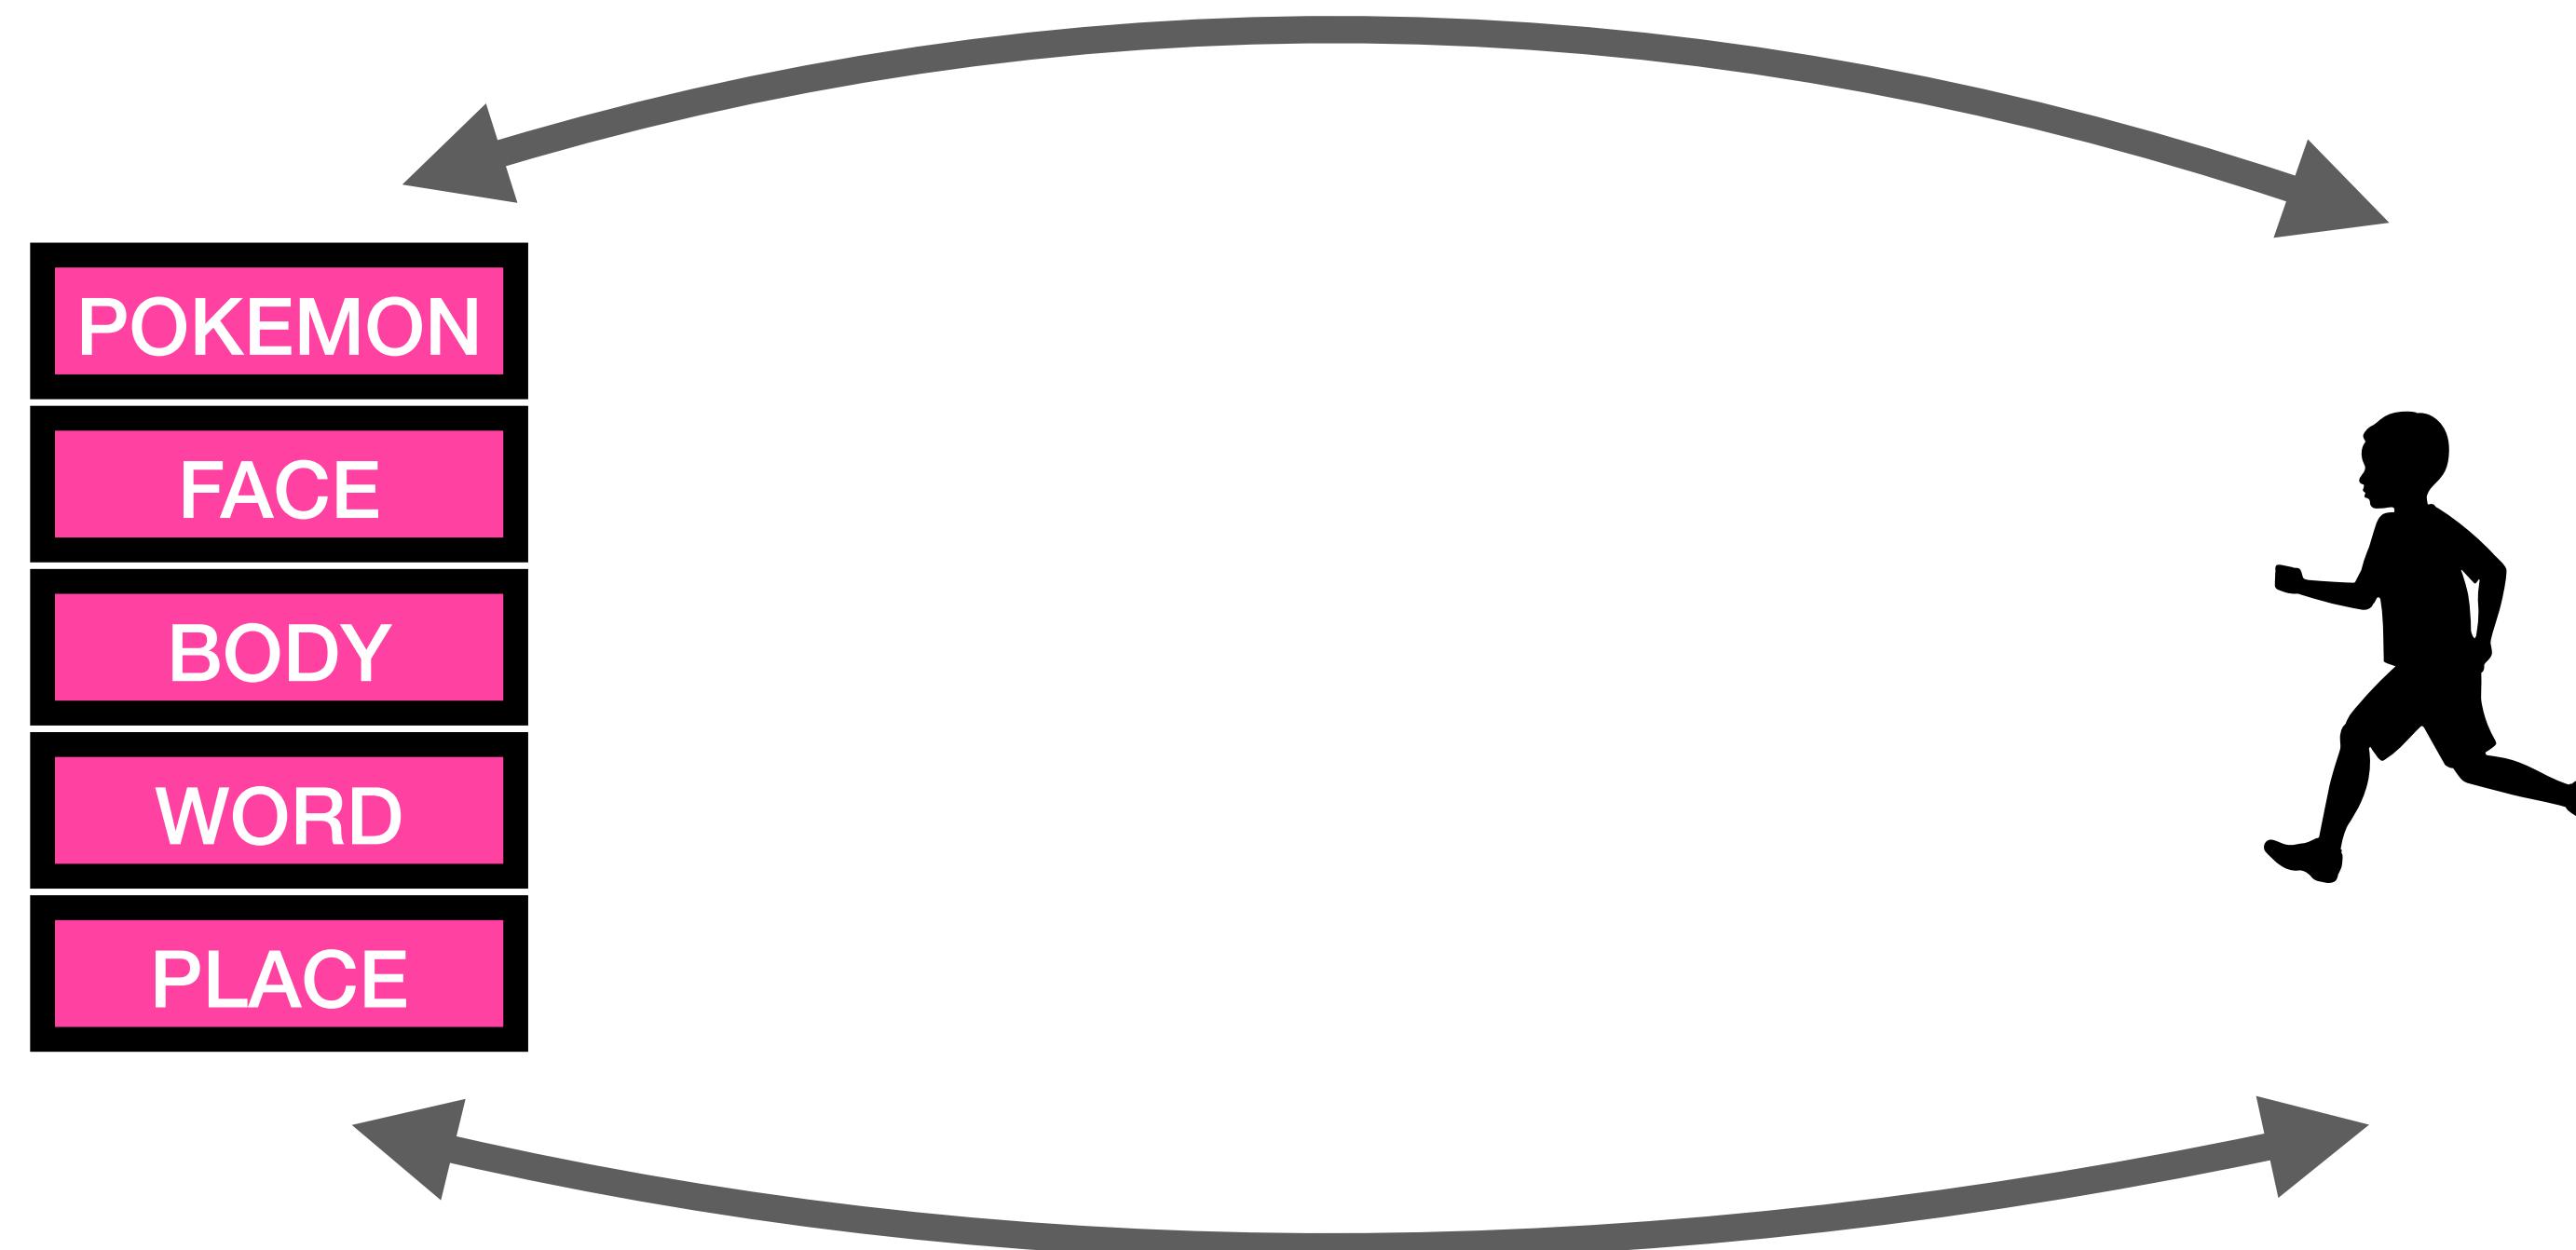

2

Does the features of Pokemon help us theorize which features of visual stimuli drives the development and topographical organization in high-level visual cortex?

# CONCLUSION

Extensive exposure to a unique stimuli led to the emergence of its own cortical representation in the VTC!

Suggests that experiences in childhood play a critical role in shaping the development of these acquired categories and sculpting the brain's responses to various stimuli

# Discussion Questions

1

**How would you describe an “experienced” Pokemon participant? Is it the video game? Or is extensively watching of the cartoon show and/or card games a component to consider as well?**

2

**Do you think there are other stimuli that could find similar results and add contextual information – like Yu-Gi-Oh!, for example? How would this help the purpose of this study? Would these have their own region or share space with Pokemon?**

3

**What do you think the implications of this study are? How does this research inform other topics in developmental cognitive neuroscience research? What does it not tell us?**

# THANK YOU!!
